African and African American Studies

African & African Amer Studies

AFRAMER 10

Introduction to African American Studies

Course ID: 122910
2026 Spring (4 Credits)

No meeting time listed

Jesse McCarthy

This course aims to provide an interdisciplinary examination of the complex array of African-American cultural and political practices from slavery to the present. The course will involve close readings of a variety of primary sources and classic texts that present key issues in African American thought and practice. The course will place special emphasis on debates concerning African American people with the goal of introducing students to the process and the methodology of interdisciplinarity. We will look at the way the debates function across disciplines to delve deeper into not only the complexity of African American life and thought but also the breadth of African American Studies itself.

Course Note: Required of concentrators in the African American Studies track. Students who transfer into the concentration after their sophomore year may substitute another African and African American Studies course already taken if the course addresses the materials covered in African and African American Studies 10, and the petition is approved by the Director of Undergraduate Studies.

AFRAMER 11

Introduction to African Studies

Course ID: 123591
2026 Spring (4 Credits)

No meeting time listed

Daniel Agbiboa

This course introduces students to the rich diversity and complexity of Africa, including its historical dynamics, economic developments, social and political practices, and popular cultures. Throughout, we assume that Africa is not a unique isolate but a continent bubbling with internal diversity, historical change, entrepreneurial spirit, and cultural links beyond its shores. Our goal is to train students to think rigorously about Africa from interdisciplinary and transnational perspectives. We also aim to equip students with the analytical tools necessary for recognizing and deconstructing reductionist and stereotyped narratives of Africa. The course is open to all students who are interested in exploring various dimensions of African life, politics, peoples and cultures from the past to the postcolony.

Course Note: Required of concentrators in African Studies track.

AFRAMER 66

History of Sport in Africa

Course ID: 226220
2026 Spring (4 Credits)

MW 0130 PM - 0245 PM

David Glovsky

This course studies African histories of politics, culture, economics, colonialism, decolonization, and more through the histories of sports. Sports and games of various kinds have played a key role in African societies for many centuries, and this course will begin with those earlier histories before looking at the role of Africa and Africans in modern sports history, a period that began in the late 19th century around the development of the Olympic games and professional leagues globally. European empires in Africa sought to impose their ideas of "civilization" and "modernity" on Africans through organized athletics, and yet Africans themselves - both during and after the period of European rule - used athletics for their own purposes. Notable athletes played a key role in both combating and supporting colonialism, and in establishing national identities following independence. In recent decades, Africans have starred globally at the Olympic Games, the World Cup, and many other global athletic competitions. And increasingly, individuals from more recent African diasporas have starred for countries around the globe, raising important questions about belonging, diaspora, and nationalism. This course will provide an introduction to these questions and more, through understanding the social, political, cultural, and economic history of sports in Africa.

AFRAMER 86

Race and Public Health Crises: From TB to AIDS to COVID-19

TR 1200 PM - 0115 PM

george aumoithe

This course explores the complex interplay between race and public health crises, from tuberculosis to AIDS and COVID-19. Students will examine the visual culture of epidemics, critically analyze systems of racial classification, and study the work of influential sociologists, political scientists and historians of medicine and public health. The course challenges students to question the racial epistemology underlying epidemiological research and practice, fostering a deeper understanding of how race has shaped and has been shaped by public health responses from the 19th century to the present. By engaging with diverse materials and perspectives, students will develop critical tools to analyze racial health disparities and their societal implications, both in historical contexts and amid contemporary health challenges.

AFRAMER 97

Sophomore Tutorial: Understanding Race and Racism

R 1245 PM - 0245 PM

Carla Martin

Course ID: 123590
2026 Spring (4 Credits)
Instructor Permission Required

This course will examine the history of race and racism – key analytical constructs that express fundamental issues not only of power and inequality, but also of justice, democracy, equity, and emancipation. The study of race in the social sciences and humanities is an established, dynamic, multidisciplinary, and international field. To understand race and racism with a global perspective, it is necessary to have a transdisciplinary, cross-cultural view to read critically the phenomena that intersect with this variable. Course readings are drawn from the fields of African and African American Studies, sociology, history, cultural studies, political science, anthropology, philosophy, journalism, and public health. The vast literature produced by scholars in diverse fields provides evidence of how race is based on narratives created to enslave, subordinate, exploit, and exclude millions of human beings across the globe. Assignments will address pressing real-world questions related to race and racism, as well as pedagogically significant areas of undergraduate intellectual and academic development.

Course Note: Required for concentrators in African and African American Studies. Open to all undergraduates.

AFRAMER 112X

Transition(s)

Course ID: 226573
2025 Fall (4 Credits)

MW 1030 AM - 1145 AM

In this introductory course, we examine and question the sameness often ascribed to African literature as a sociological and anthropological archive. We will explore stories of mobility, movement, and exchange, drawing from the archives of *Transition*, a magazine founded in 1961 in Kampala, Uganda, and now housed at Harvard. *Transition* fostered some of the most engaging intellectual debates of its time, introducing a critical idiom that shaped a generation's postcolonial and postnational critiques. Many of its contributors were young, ambitious thinkers who used the magazine to express and refine their ideas (e.g., Bessie Head, Ngugi waThiong'o, Wole Soyinka). Through *Transition*, and with the understanding that 'the archive is a very important place to go' (Simon Gikandi), students will learn to engage with primary sources, critically analyze historical and literary materials, and examine the evolution of African literature. The course emphasizes close reading, archival research, and contextual analysis, equipping students with the tools to understand how African literature has been formed and how it continues to evolve. By exploring the transitions, transformations, and translocations in African literature, we will experience genre formation and establish key foundations: Where did African literature come from? How, when, and why did the idea of literature in the modern sense emerge in Africa? What is the utility of a term like 'African literature' and the idea of a field of African literary studies

AFRAMER 119X

Chocolate, Culture, and the Politics of Food

Course ID: 108879
2026 Spring (4 Credits)

Carla Martin

This course will examine the sociohistorical legacy of chocolate, with a delicious emphasis on the eating and appreciation of the so-called "food of the gods." Interdisciplinary course readings will introduce the history of cacao cultivation, the present day state of the global chocolate industry, the diverse cultural constructions surrounding chocolate, and the implications for chocolate's future of scientific study, international politics, alternative trade models, and the food movement. Assignments will address pressing real world questions related to chocolate consumption, social justice, responsible development, honesty and the politics of representation in production and marketing, hierarchies of quality, and myths of purity.

American Democracy

2026 Spring (4 Credits)

T 1245 PM - 0245 PM

John Stauffer, Roberto Mangabeira Unger

Democracy, inequality, and nationalism in America. The white working class and American politics. Class and race. Identities and interests. Conditions for socially inclusive economic growth and for the deepening and dissemination of the knowledge economy. Alternative directions of institutional change, viewed in light of American history. Democratizing the market and deepening democracy. Self-reliance and solidarity. We explore and discuss the past, present, and especially the future of the American experiment among ourselves and with invited guests: thinkers, politicians, social activists, and entrepreneurs. Readings drawn from classic and contemporary writings about the United States. Extended take-home examination.

Tobacco and Sugar, Seminar in Caribbean Counterpoints

2026 Spring (4 Credits)

T 1200 PM - 0245 PM

Doris Sommer

Cuban Counterpoint: Tobacco and Sugar (Fernando Ortiz 1940) will guide explorations of aesthetic and historical tensions throughout the Spanish Caribbean. Different crops produced different political/cultural responses. Along with musical forms, plastic arts, and politics, we concentrate on literary works including abolitionist Cecilia Valdés, *El reino de este mundo*, the Dominican Over, Puerto Rico's *La charca*, Jamaica's *Wide Saragasso Sea*, writings by Hostos, Bonó, Mintz, Klein, among others.

AFRAMER 133Y

Course ID: 224623

The Politics of Paradise: Tourism in Latin America & the Caribbean

2025 Fall (4 Credits)

T 1200 PM - 0245 PM

Instructor Permission Required

Amber Henry

What does tourism sell? How do destination images condition our perceptions of native people, public space and collective memory? This seminar explores tourism beyond its facile association with leisure to consider its implications for development, environmental protection, heritage conservation, and the commodification of history. Treating tourism as an enterprise that trades in everything from sensory fantasies to cheap cosmetic surgeries and pictures of tropical paradise, this course contemplates the role of the imaginary in the political and the political in the imaginary. Through careful analysis of travel journals, audiovisual material and first hand accounts from culture brokers and travelers alike, we'll explore the industry's colonial past in relation to Black, Indigenous and queer people's efforts to bend tourism towards a more liberatory future. While geographically situated in Latin America and the Caribbean, the course draws from comparative contexts in continental Africa and the United States to critically analyze tourism in relation to colonialism, the plantation economy, African diasporic kinship and the afterlives of slavery. Readings include classic texts such as Jamaica Kincaid's (1988) *A Small Place*, Kamala Kempadoo's *Sun, Sex and Gold* (1999) Paula Ebron's *Performing Africa* (2002), Mimi Sheller's *Consuming the Caribbean* (2003) and Saidiya Hartman's *Loose Your Mother* (2008). These works will be paired with Florence Babb's *The Tourism Encounter* (2010) Jemima Pierre's *Predicament of Blackness* (2009) Krista Thompson's *An Eye for the Tropics* (2016), and recent ethnographies such as Christen Smith's *Afro-Paradise* (2016), Megan Rivers-Moore's *Gringo Gluch* (2016) Patricia Pinho's *Mapping Diaspora* (2018), Bianca Williams's *The Pursuit of Happiness* (2018), Corinna Campbell's *The Cultural Work* (2020), and Anadelia

AFRAMER 134Y

The Philosophy and Politics of Malcolm X and Martin Luther King, Jr.

W 1200 PM - 0245 PM

Brandon Terry

Course ID: 226521
2025 Fall (4 Credits)

Instructor Permission Required

This seminar for graduate students and undergraduates with backgrounds in political theory, philosophy, or African American Studies undertakes a rigorous examination of the political lives and philosophical thought of Malcolm X and Martin Luther King, Jr. Through their speeches, writings, debates, and unpublished texts, we will engage critically with their evolving visions of justice, democracy, and social transformation. We will read both figures in dialogue with their intellectual influences and critics to evaluate their views of liberalism, nationalism, civil disobedience, political violence, self-defense, internationalism, political theology, democracy, war, and economic justice among other themes. By studying these towering figures side by side, this course will illuminate fundamental questions about political ethics, racial justice, and the possibilities and limits of radical social change in the past and present.

AFRAMER 135Y

Black Feminist Theory Seminar

T 0900 AM - 1145 AM

Imani Perry

Course ID: 222229
2026 Spring (4 Credits)

Instructor Permission Required

This course traces the development of Black feminist theory and thought, from 19th century thinkers such as Anna Julia Cooper, Maria Stewart, Ida B. Wells through 20th century movements including identity politics, standpoint theory, matrices of domination, intersectionality, as well as Marxian and liberation feminism. Students will be expected to develop critical fluency with the movements and concepts covered and apply them to social, cultural, and political issues.

AFRAMER 143Y

African Landscape Architecture: Alternative Futures for the Field

No meeting time listed

Gareth Doherty

Course ID: 224017
2026 Spring (4 Credits)

Instructor Permission Required

A central aim of this seminar is to reveal the plurality of ways landscapes are shaped across the African continent and how they help mitigate the impacts of changing climates and social injustice now and in the future. Africa is a continent rich in landscape projects and practices but only eight out of fifty-four African nations have professional associations of landscape architects. The course is framed around three central questions: 1.) How is landscape architecture currently practiced in African countries? (2.) What lessons can we learn from landscape practices in various African societies that can help mitigate the impacts of climate change and social inequities? (3.) As landscape architecture unfolds across the continent in the next 50–200 years, how can it continue assert its agency in the fight against changing climates and social inequity and claim a central space in the shaping of African cities of the future? Each week we will focus on a different country including South Africa, Botswana, Tanzania, Rwanda, Kenya, Ethiopia, Egypt, Tunisia, Morocco, Côte d'Ivoire, Ghana, and Nigeria. In collaboration with several landscape architecture university programs across Africa and including practitioners and academics from across the continent, this seminar will explore what it means to practice and teach landscape architecture in societies in which the profession is nascent or non-existent and speculate on the future of the shaping of landscapes in the Global South.

AFRAMER 146X

A Black History of Electronic Dance Music

Course ID: 222657
2025 Fall (4 Credits)

W 1200 PM - 0245 PM

george aumoithe

Electronic dance music. Mentioning the genre elicits questions over origins and boundaries. While oft forgotten, Black queer, femme, and non-binary people invented the modern-day genre's arrangement, composition, production, and distribution, undergirding distressed communities' sonic landscapes, enlivening social movements, and seeding multibillion-dollar markets. From disco to house to techno, each seminar will crisscross wide-ranging geographies including Chicago, Detroit, New York, and Manchester, United Kingdom. We will pair essential LPs, EPs, singles, and bootleg recordings with thematically linked texts in history, musicology, and theory to ask how Black electronic musicians responded to history's unfolding.

African American Fraternal Associations in U.S. Society and Politics

W 0300 PM - 0500 PM

Theda Skocpol

Course ID: 225711
2026 Spring (4 Credits)

Instructor Permission Required

Cross-class fraternal associations were long central to African American civil society. Using unique primary sources as well as secondary works, this research seminar explores the development of a range of fraternal orders that flourished from the mid-1800s through the Jim Crow and Civil Rights eras. Case studies include the largest U.S.-centered transnational associations; fraternal groups founded and led by Black women; and the small number of groups that tried to include both Blacks and whites. Special attention paid to relations of Black fraternal orders to churches, businesses, unions, the NAACP, and other civil rights endeavors.

African Language Archives in disciplines and professions

MW 1030 AM - 1145 AM

John Mugane

Course ID: 224461
2025 Fall (4 Credits)

Instructor Permission Required

Language is a fundamental for thought and communication, playing a vital role in human achievements and societal progress. This course explores African languages as rich sources of knowledge that require collection and cataloguing using current AI technologies. By examining archives of African thought and life, students will delve into how archival information can be shared across languages. The course emphasizes the significance of African languages as instruments of thought, expressed through signs and sounds, in various domains such as constitution writing, food production, governance, religion, and environmental use/protection. Students will critically engage with the organic sociality of vernacular spaces, including church rooms, courtrooms, classrooms, hospital rooms, and entrepreneurial spaces, where African languages are linguistically accessible. Course Objectives:- Understand the role of language as an instrument of thought and communication in African societies.- Explore African languages as archives of knowledge and their importance in preserving cultural heritage.- Gain knowledge of AI technologies and their application in collecting and cataloguing African language archives.- Examine the significance of archival information sharing across different African languages.- Analyze the critical engagements that take place in vernacular spaces and their impact on African communities.- Understand the linguistic accessibility of African languages in various social contexts.

Abolition, Then and Now

Course ID: 226604
2026 Spring (4 Credits)

The modern American prison abolition movement consciously evokes the nineteenth century movement to abolish slavery. The institutions each movement sought to end—chattel slavery and the contemporary carceral state—are also directly linked, by intersecting lineages and genealogies, and by the text of the Thirteenth Amendment, which outlawed slavery "except as a punishment for crime" and thus preserved the legality of American slavery to this day, within prisons. This course examines these linkages between institutions of coercive state power and between the movements that oppose them and seek to build different social systems, norms, and structures in their wake.

Religion, Culture, and Society in Africa

R 0300 PM - 0545 PM

Jacob Olupona

Exploring the meaning of religion and its impact on African culture and society broadly, this course will highlight both religious traditions and innovations. Instead of treating each of the religions of Africa, the triple heritage in the words of Ali Mazrui of indigenous African religions, Islam, and Christianity, as distinct and bounded entities, we will explore the hybridity, interaction, and integration between categories throughout Africa. Using case studies, a unique perspective on religious diversity on the African continent and diaspora will emerge.

AFRAMER 191X

African American Lives in the Law

R 1245 PM - 0245 PM

Evelyn Brooks Higginbotham

This seminar focuses on biographical and autobiographical writings in a historical examination of the role of the individual in the American legal process. We will seek to understand how specific African Americans (as lawyers, judges, and litigants) made a difference-how their lives serve as a "mirror to America"-and also to understand the ways personal experience informs individual perspectives on the law and justice.

FAS Divisional Distribution: Social Sciences

AFRAMER 197

Poverty, Race, and Health

T 1245 PM - 0245 PM

David Williams

This course critically examines the health status of the poor, and of African Americans and other socially disadvantaged racial and ethnic groups in the US. Attention will be focused on the patterned ways in which the health of these groups is embedded in the social, cultural, political, and economic contexts, and arrangements of US society. Topics covered include the meaning and measurement of race, the ways in which racism affects health, the historic uses of minorities in medical research, how acculturation and migration affects health, and an examination of the specific health problems that disproportionately affect nondominant racial groups.

Requires: Course open to Undergraduate Students Only

AFRAMER 201

Theory and Race in Africa

R 0345 PM - 0545 PM

Daniel Agbiboa

This course focuses on theoretical debates and frameworks in African studies from the past to the postcolony. The course strives to open up a critical, open-ended discussion that treats Africa as People, and reclaims the epistemic freedom and virtue of African people through a double-consciousness of deprovincializing Africa and provincializing Europe. The course will examine the lines of knowledge production in Africa, beyond hegemonic Eurocentric knowledge-production, with the aim of achieving what the writer Chinua Achebe calls a "balance of stories." What, for instance, does a decolonized, African-centered approach to knowledge production look like? Ultimately, the course belies entrenched and racialized notions of Africa as a residual category, the study of which adds nothing (theoretically) meaningful to world knowledge or the human condition.

AFRAMER 210

W.E.B. Du Bois and His Critics

M 1200 PM - 0245 PM

Henry Gates

Course ID: 223916

2026 Spring (4 Credits)

Instructor Permission Required

W. E. B. Du Bois was among the most profound thinkers of his time, devoting a forensic and evolving attention to the issue of race over a varied career that extended from the turn of the century to his death on the eve of the March on Washington in 1963. Although he earned his PhD from Harvard in history, he is increasingly seen as one of the pioneering scholars in the then-nascent field of sociology. In this course, we will employ a structure of text and critique to evaluate the reach and utility of his ideas, on subjects ranging from the development of racial consciousness to nuclear disarmament to the international order and the role of Africa, Africans, and African Americans in it. This course will examine Du Bois's original writings in the context of the debates they sparked and will revisit his interactions with key figures, both Black and white, of the twentieth century.

AFRAMER 219A

Race and Ethnicity in Latin America

R 1245 PM - 0245 PM

Alejandro de la Fuente, Paulina Alberto

Course ID: 213432

2025 Fall (4 Credits)

Instructor Permission Required

This yearlong seminar introduces students to current questions and debates in the study of race and ethnicity in Latin America, from the colonial period to the present. Our seminar answers the call, issued by anthropologist Peter Wade (1997), to produce scholarship integrating the study of Africans and their descendants, along with indigenous peoples, as participants in shared processes of racial formation, nation making, and state building. Through the systematic comparison of several cases, the course discusses how ideas of race have shaped processes of nation and state formation in Latin America, shaping opportunities for mobilization and public policies; how racial identities have been formed and invoked for different cultural and political purposes; and how ideas of race and ethnicity have contributed to the stratification of Latin American societies, which are among the most unequal in the world.

Comparative Slavery & the Law: Africa, Latin America, & the US: Seminar

W 1245 PM - 0245 PM

Emmanuel Akyeampong, Alejandro de la Fuente

Course ID: 110499

2025 Fall (4 Credits)

This seminar surveys the booming historiographies of slavery and the law in Latin America, the United States, and Africa. Earlier generations of scholars relied heavily on European legal traditions to draw sharp contrasts

between U.S. and Latin American slavery. The most recent scholarship, however, approaches the legal history of slavery through slaves' legal initiatives and actions. These initiatives were probably informed by the Africans' legal cultures, as many of them came from societies where slavery was practiced. Our seminar puts African legal regimes (customary law, Islamic law) at the center of our explorations concerning slaves' legal actions in the Americas.

AFRAMER 223

Storied Lives: Methods in Oral History

T 0300 PM - 0545 PM

Amber Henry

Course ID: 225837

2026 Spring (4 Credits)

Instructor Permission Required

How can we understand the lives of people who are excluded from the historical record? How might attention to the time and space in which words are spoken allow us to treat oral history as text, and text as oral history? This course explores storytelling as a foundational element of the human experience. It analyzes the myriad ways in which orality has been used to consolidate origin stories, document events, communicate embodied experience, and transfer ancestral knowledge. By centering methodology, students will learn to prepare, collect, analyze, and share oral histories in a variety of written, digital, and artistic forms. Topics of discussion include how to build relationships, conduct interviews around difficult topics, and use citational practices that honor nonhuman and other-than-human actors. Required readings pair classic and new oral histories with texts on the theory, practice, and ethics of storytelling. By centering works by Black, Indigenous, gender minorities, and writers of color, the course examines how storytelling is used to establish and redistribute power. At the end of the semester, students will become familiar with audio-visual recording technology, learn to navigate transcription and coding software, and be able to conduct, transcribe and analyze an oral history.

AFRAMER 224

African Postcolonial State

W 0945 AM - 1145 AM

David Glovsky

Course ID: 226221

2025 Fall (4 Credits)

Instructor Permission Required

This course, primarily for graduate students, is designed to analyze the form and function of the postcolonial state in Africa. Decolonization left African states and policymakers with many decisions regarding what states should do politically, economically, socially, and culturally. How should states create a national identity out of an emerging anti-colonial consciousness? Given the challenges of colonial rule, how could postcolonial state create vibrant economies and durable political systems, especially given the damage done by colonial rule. This seminar will engage with the newest works by historians, anthropologists, political scientists, and other scholars who have analyzed the postcolonial state in Africa, drawing on case studies from across the continent.

AFRAMER 225

People of Print

T 1200 PM - 0245 PM

Course ID: 226572

2025 Fall (4 Credits)

When does an African book begin or end? This course investigates new and experimental African book forms that have emerged in recent years. Since 2000, a new generation of writers, readers, and publishers has moved away from the African Writers Series model toward a more artisan approach—one that integrates design, print, and aesthetics. Our primary focus will be the Chimurenga Library (based in Cape Town, South Africa), which, in its rhizomatic way, references contemporary and past systems of knowledge. The history of print in Africa has largely been shaped by the logic of colonial control and mission education. Here, we will explore how African literary production has undergone radical reformulations in the 21st century, transforming both the literary canon and the archive as conceptual and physical spaces—sites where memories are preserved, history is decided, and possibilities for reactivation emerge. We will consider the African text as a performative and participatory event that extends the book beyond its traditional boundaries and into dynamic modes of engagement.

AFRAMER 234

Black Classicisms: A Research Seminar and Pedagogy Workshop

W 0300 PM - 0500 PM

Emily Greenwood

Course ID: 220551

2025 Fall (4 Credits)

Instructor Permission Required

From the enslaved poet Phillis Wheatley writing in Boston in the 1760s and 1770s, to contemporary authors and artists in Africa, the Caribbean, and the US, this lecture course will explore uses of ancient Greek and Roman Classics in the literatures, arts, and thought of Africa and the Black Diaspora. We will analyze how African and black diasporic authors and intellectuals have engaged with, revised, and re-imagined the classics of ancient Greece and Rome, both to expose and critique discourses of racism, imperialism, colonialism, and white supremacy, and as a rich source of radical self-expression. The course will be arranged thematically, taking in uses of Classics in literature, art, journalism, and politics. Writers, artists, and politicians whose work and ideas we will study include Phillis Wheatley, William Sanders Scarborough, Anna Julia Cooper, Pauline Hopkins, Mary Church Terrell, Edmonia Lewis, W.E.B. Du Bois, Aaron Douglas, Romare Bearden, Bob Thompson, Gwendolyn Brooks, Ralph Ellison, Rev. Martin Luther King Jr., Fran Ross, Toni Morrison, Rita Dove, Harryette Mullen, Spike Lee, Hastings Kamuzu Banda, Ola Rotimi, Athol Fugard, John Kani, and Winston Ntshona, Wole Soyinka, Njabulo Ndebele, C.L.R. James, Eric Williams, Aimé Césaire, Derek Walcott, Kamau Brathwaite, Austin Clarke, Marlene NourbeSe Philip, and Dionne Brand. In addition to works by individual authors, lectures will also attend to the circulation of Greek and Roman classical myths, history, and thought in vernacular cultures. Throughout, we will be attentive to the relationship between national contexts and transnational histories and networks, and the phenomenon of classical appropriation in invented modern traditions.

AFRAMER 245

Pedagogies of Liberation: Race, Gender, and Class(rooms)

T 1200 PM - 0245 PM

Doris Sommer, Adriana Gutierrez

Course ID: 226215

2025 Fall (4 Credits)

Instructor Permission Required

This course is meant as preparation and accompaniment for new teachers of language and literature. It is designed for anyone dedicated to developing a pedagogical praxis that alternates between theory and implementation. The objective is to achieve a rigorous theoretical framework for the formative work of language instruction that supports literary analysis. The exemplary teachers featured in this course display a remarkable coherence of good practices that remain "alternative" to normalized approaches that are less effective intellectually and less supportive socially. For the final project, students will present a potential series of lessons inspired by one or more of the featured theorists. For graduate students of literature in RLL, language arts are the featured vehicle for language instruction. Learning and teaching Romance languages combines technical mastery with creative and critical skills. To develop this interlocking range of skills we count on foundational pedagogies from Romance Language territories and beyond. Our pedagogical pioneers share a mission to democratize societies marked by legacies of slavery, extractionism, and patriarchy.

There will be an additional 1-hour clinic with Dr. Gutierrez, time to be arranged.

Sophomore Tutorial in Social Anthropology

Course ID: 143028
2026 Spring (4 Credits)

TR 1030 AM - 1145 AM

Instructor Permission Required

Malavika Reddy

This course is designed to introduce undergraduate students to social/cultural theory in light of anthropological methods, arguments, concerns, and writing. As a discipline, anthropology is rooted in conveying and theorizing the particularities of lived social realities—which are often messy, complex, and unruly. On the other hand, social theory tends to provide a more abstract, though still empirically grounded, analytical framework, concepts, and theories about the nature of social life, the body, power, the economy, etc. While this class will introduce students to bodies of theory that have been particularly influential in anthropology, this course does not offer a general survey of social theory. The course seeks primarily to train students to learn how to read and write about theory in light of anthropological concerns, writing, and ethnography that you will come across in your concentration.

Course Note: Required of all concentrators. Weekly 2-hour sections to be arranged.

FAS Divisional Distribution: Social Sciences

ANTHRO 98A

Junior Tutorial in Anthropology

Course ID: 205494
2025 Fall (4 Credits)

M 1200 PM - 0115 PM

Instructor Permission Required

Damina Khaira

ANTHRO 98a is a research design course: geared towards guiding and developing an anthropological research project that you are curious and passionate about. We will read, discuss and consider case studies that reflect lived experiences from diverse communities and contexts across a variety of topics and frameworks within the discipline. As we walk through on-the-ground and recorded examples of ethnographic/ archaeological research, we will explore and compare different approaches in identifying research problems, conducting research, and writing anthropologically. We will also read latest works produced by departmental faculty, including your Tutor, to get a sense of the range of topics, questions, and new methods that are possible in anthropological research.

This course also offers you a space to then apply what you have learned through designing your projects and sharing your research goals, experiences, and components of your emerging work with peers for feedback. Through structured assignments, seminar workshops, discussions with invited faculty and regular individual meetings with instructors, you will produce an original anthropological essay based on your research over the course of the semester. In short, this course will arm you with the critical tools to start thinking about your own independent research project. Please note that the research project you start to brainstorm in this course does not have to be your Senior Thesis project. In other words, your chosen research topic for this semester is only for the purposes of this course, and you are not confined to this research topic beyond this semester, although you can certainly continue to pursue this same research topic. As part of this course, you will be asked to reach out to at least one departmental faculty member to discuss the direction and feasibility of your research ideas. Please note that this course has a weekly 1.5 hour course meeting that is complemented with 1 hour tutorial/section meetings with your Tutor.

Course Note: Required of all concentrators in Anthropology.

ANTHRO 98B

Junior Tutorial for Thesis Writers in Anthropology

No meeting time listed

Damina Khaira

Course ID: 205522
2026 Spring (4 Credits)

Instructor Permission Required

This individual tutorial is for anthropology students intending to write a senior thesis, and is normally undertaken with an advanced graduate student during the second term of junior year. Students will have weekly meetings with the project advisor for the purposes of developing the appropriate background research on theoretical, thematic, regional, and methodological literature relevant to their thesis topic, and fully refining their summer research proposal. The tutorial's final paper will be comprised of a research proposal representing the research undertaken during the semester.

ANTHRO 1602

Introduction to Sociocultural Anthropology

MW 1030 AM - 1145 AM

Nicholas Harkness

This course introduces undergraduate students to the discipline of Sociocultural Anthropology. Lectures will develop and explain sociocultural anthropology's central questions and discoveries, concepts and innovations, methods and theories, placing each in their historical and political context. The course will give special attention to two distinctive, interrelated, and sometimes controversial features of the discipline within the social sciences: culture as a foundational concept for social analysis, and ethnography as a foundational research method and mode of social representation.

FAS Divisional Distribution: Social Sciences

Course ID: 224348

2025 Fall (4 Credits)

ANTHRO 1603

Law and Its Limits

W 0300 PM - 0545 PM

Malavika Reddy

We often talk about the power of law to shape our worlds but what about its powerlessness? An axiom of contemporary life is that societies need law to address social, political and environmental ills. Yet, in the face of entrenched problems, law often appears impotent or, worse, detrimental. This course grapples with the simultaneous hunger for and weakness of law, its power and its powerlessness, by guiding students through an exploration of the following questions. What is the relation between law and violence? How does legal process transform conflict and define the terms of its resolution? Can law restrain arbitrary power? How, why and to whose benefit or expense is the legal posed as an answer to political and social problems? The course will seek answers to these questions via an engagement with the ethnographic – close readings of a variety of judicial processes -- and the theoretical. In so doing, the course will be guided by two objectives: 1. to compile a toolkit of methods and concepts with which social scientists have studied law and 2. to trouble commonsense pieties about law and its place in social life.

ANTHRO 1610

Ethnographic Research Methods

R 1200 PM - 0245 PM

Anthropology is defined by its unique approach to the study of human subjects through what we call "ethnographic methods." This course, required for undergraduate anthropology concentrators at Harvard, will use the genre of ethnography (texts—written, visual, etc—produced by anthropologists) to discover how anthropologists have approached various social phenomena throughout the history of the discipline. In doing so, we grapple with the legacy of anthropology's colonial past to understand questions of power and knowledge production in social anthropological thought. The texts chosen for this course both give insight into the history of the discipline and the wide variety of human (and non-human) existence that anthropologists have written about, with particular attention to pressing ethical questions in contemporary debates in social anthropology. Additionally, the texts chosen represent a variety of writing styles, theoretical approaches, and worldviews that introduce you to the exciting breadth of this ambitious discipline, which strives to give a holistic analysis of what it means to be human. The course consists of one lecture/seminar meeting a week plus a required section with a Teaching Fellow.

Course Note: Open to undergraduates only.

Course ID: 119379

2025 Fall (4 Credits)

Instructor Permission Required

ANTHRO 1691

Mobility in Asia

M 0300 PM - 0545 PM

Course ID: 226247
2025 Fall (4 Credits)

How does movement reshape our understanding of contemporary Asia? What happens when we shift our gaze from fixed places to flows of people, ideas, and things? In this introductory-level class in sociocultural anthropology, we explore how mobility creates new social landscapes across the region. Through anthropological methods—especially immersive fieldwork and ethnographic writing—we will examine how historical patterns of migration and present-day movements are shaped by structural dynamics of colonialism, late capitalism, labor markets, trade networks, and supply chains. Through ethnographic encounters that reveal the complexity of mobility: from maritime trade in the Indian Ocean to domestic workers in Singapore, from transnational mothers in Filipino families to Islamic networks in Southeast China, from Persian rug merchants to Japanese-Philippine solidarity trade. Through these examples, we explore how restrictive policies create new regimes of (im)mobility and forms of nationalism, while also examining the lived experiences of individuals and families involved in transnational lives. The seminar guides students through key themes including physical geography, commodity chains, religious networks, and logistics systems. At the end of the class, students will develop conceptual tools to examine the mechanics of mobility, equipping them to address the pivotal questions emerging from our increasingly interconnected world.

The instructor for this course will be Prof. Ping-hsiu Alice Lin.

ANTHRO 1829

Health Science and the "Replication Crisis": Anthropological Perspectives

R 0300 PM - 0545 PM

Lindsey Zeve

Course ID: 226565
2025 Fall (4 Credits)

Instructor Permission Required

Over the last two decades, health scientists have grown increasingly concerned about a perceived methodological crisis centered on the reliable replication of research findings—a crisis exacerbated by growing public mistrust in science, which reached a fever pitch in the wake of the global COVID-19 pandemic. This seminar draws on anthropological perspectives to examine critically what has come to be known as the "replication crisis" in health science. Framing the crisis both as a moment of danger and of radical possibility, together we will explore how debates over replication illuminate deeper questions regarding the nature, stakes, and commitments of health science and its objects of study, as mediated through themes of representation, causality, error, epistemic virtue, risk, uncertainty, and objectivity. In doing so, we will consider how scientific authority is constructed and contested; how the replication crisis affects public trust, lay participation, and broader engagements with health and science; and unexpected opportunities the crisis may present to advance the cause of health equity. Through ethnographic readings, case studies, and interdisciplinary scholarship, students will analyze the drivers of the crisis and consider its implications for the future of scientific knowledge-making and health care delivery.

ANTHRO 1831

The Voice

T 1200 PM - 0245 PM

Nicholas Harkness

Course ID: 226246
2025 Fall (4 Credits)

What is the voice? Where is the voice? Whose voice is it? This course is an exploration of the way different scholarly disciplines, thought traditions, and cultural systems have oriented to the human voice. We will consider the voice as, among other things, an object, a medium, a concept, a metaphor, and a philosophical problem. The voice will take us to the linguistics of speech, the aesthetics of song and musical composition, the anatomy and evolution of the human throat, the stylistics and narrative of literature and storytelling, technologies of speech recognition and artificial production, the structures of political participation and activism, the rituals of spiritual contact and possession, the expressive dimensions of social identity, the interior dimensions of selfhood, and the circulating media of global social life. Seminar meetings will consist of a combination of lecture, class discussion, student presentations, and media analysis. No special background is required—only a willingness to read widely across scholarly paradigms, listen very carefully, and engage with the full complexity of the topic.

ANTHRO 1836AR

Sensory Ethnography 1

No meeting time listed

Lucien Castaing-Taylor

Course ID: 156390
2026 Spring (4 Credits)

Instructor Permission Required

An introduction to "sensory ethnography," a media practice that seeks to rejuvenate and innovate in visual anthropology, cinema, and art. Students will learn to record and edit video and audio to produce original media works about embodied experience, culture, ecology, political-economy, and history. This is a year-long course that supports students' independent projects through the summer and the following semester.

Course Note: This course is also offered as AFVS 158AR.

*Students are strongly encouraged to enroll in ANTHRO 1836BR, Sensory Ethnography 2.
No previous studio experience necessary.*

ANTHRO 1839

Audio in Multimodal Practice

No meeting time listed

Course ID: 215955
2026 Spring (4 Credits)

Instructor Permission Required

This experimental, practice-based course presents an opportunity for students engaged in audiovisual work, whether in the (overlapping) contexts of media anthropology, critical media practice, film, or art, to focus primarily on the sonic aspects of their experiments in nonfiction, and to gain experience in working with audio in conjunction with other media. Modes of practice will include audio recording, sound design, editing, and postproduction. We will begin by examining the rubric of "multimodality" in the context of anthropology, and its ethical implications and possibilities for approaches to sensory ethnography. Projects will ideally be ones already underway by each student, and will also include opportunities for collaboration with fellow students. Through readings and listening sessions (or "screenings") we will also listen beyond the academy to experiments in other domains, including sound art, ethnographic film, and other nonfiction media practices. The course seeks to problematize, perhaps even undermine, and reformulate ideas and practices which combine audio with moving image or other media. Aesthetics and ethics, theory and technique, concept and practice are interwoven at every level in multimodal work, and so this course will combine technical workshops with working through conceptual and theoretical motivations and implications of the work throughout the semester. Rather than taking up conventions or formulae, the course will provide a space for experimentation, to reconsider possibilities in an expanded sense of nonfiction for relationships between audio and image, text, or other media.

The instructor for this course will be Ernst Karel.

FAS Divisional Distribution: Arts and Humanities

Counseling as Colonization?

M 1200 PM - 0245 PM

Instructor Permission Required
Joseph Gone

American Indian, First Nations, and other Indigenous communities of the USA and Canada contend with disproportionately high rates of "psychiatric" distress. Many of these communities attribute this distress to their long colonial encounters with European settlers. Concurrently, throughout the 20th century, the disciplines and professions associated with mind, brain, and behavior (e.g., psychiatry, psychoanalysis, psychology) consolidated their authority and influence within mainstream society. These "psy-ences" promote their professional practices (e.g., diagnosis, psychotherapy) as plausible remedies for Indigenous social suffering, but many Indigenous communities remain skeptical of—and resistant to—these clinical approaches, primarily for cultural and political reasons. In this seminar, we will consider whether and how the concepts, categories, tools, and techniques of the mental health professions might be appropriately adapted and/or adopted for use with Indigenous communities in an increasingly globalized world. In recognition of the (post)colonial status of these populations, we will attend closely to alterNative cultural and spiritual approaches that have been identified and promoted by Indigenous people themselves as conducive to healing and wellness. This course is designed for upper-level undergraduate students interested in medical anthropology, professional psychology, pre-medicine, Indigenous studies, and related social and health sciences. Students will participate in regular seminar discussions, write routine responses to assigned readings, and submit major independent research papers addressed to the promotion of Indigenous well-being. Student engagement and exchange during class is essential, so routine attendance and participation are expected throughout the semester.

FAS Divisional Distribution: Social Sciences

Catastrophes across Cultures: The Anthropology of Disaster

MW 0130 PM - 0245 PM

What is the relationship between "catastrophe" and human beings, and how has "catastrophe" influenced the way we live in the world now? This course investigates various types of catastrophes/disasters (i.e., earthquakes, tsunamis, hurricanes, oil and chemical spills, wars, nuclear disasters, climate change, etc.) around the world (Chernobyl, England, India, Haiti, Japan, Lisbon, New Zealand, U.S., etc.) by mobilizing a variety of theoretical frameworks and case studies in the social sciences. The course uses an anthropological perspective as its principal lens to comparatively observe often forgotten historical calamities worldwide. The course is designed to explore the intersection between catastrophe and culture and how catastrophic events can be a window through which to analyze society critically and vice versa.

The instructor for this course will be Prof. Ryo Morimoto.

FAS Divisional Distribution: Social Sciences

Zooarchaeology

MW 1030 AM - 1145 AM

Shayla Monroe

Laboratory course on the fundamentals of faunal analysis, including skeletal anatomy, species identification, acquisition and quantification of primary and secondary osteological data, and interpretation of data using zooarchaeological theory and ethnoarchaeological case studies /experimental archaeology.

GIS & Spatial Analysis In Archaeology
No meeting time listed
Instructor Permission Required
Jason Ur

An introduction to the GIS and remote sensing methods used by archaeologists to document and analyze datasets at the scale of the site and the region. This class will involve the hands-on use of printed maps, aerial photography, satellite imagery, digital terrain models, GPS-based observations, and UAV (drone) photogrammetry to approach archaeological research questions. Students will gain competence in creating

spatial data for fieldwork, print publication, and online visualization (web maps and 3D modeling), and in basic spatial analysis of archaeological datasets. Labs will use data from the instructor's Middle Eastern case studies, but students will be responsible for assembling a GIS database for their own region of interest.

FAS Divisional Distribution: Social Sciences

ANTHRO 2061

Advanced Archaeological Science

Course ID: 221673
2026 Spring (4 Credits)

No meeting time listed

Instructor Permission Required

Christina Warinner

ANTHRO 2061 is an advanced Archaeological Science. Students enrolling in ANTHRO 2061 are expected to have completed the course ANTHRO 1060 or an equivalent course. ANTHRO 2061 offers the opportunity for graduate students and advanced undergraduates to gain hands-on practical experience in archaeological science laboratory methods. Students will undertake an independent bimolecular archaeological science project over the semester which will involve wet chemistry laboratory work, data analysis, and interpretation of the results in an archaeological context. In addition, students will learn the basis of drafting a project proposal, keeping laboratory notebooks, and writing a scientific grant or article.

Students enrolling in ANTHRO 2061 are expected to have completed the course ANTHRO 1060 or an equivalent course.

FAS Divisional Distribution: Social Sciences

ANTHRO 2070

Archaeological Method and Theory: Seminar

Course ID: 120489
2025 Fall (4 Credits)

R 0900 AM - 1145 AM

Rowan Flad

This graduate-level seminar considers the varied ways in which archaeologists make inferences about human behavior from the archaeological record. The course will review the principal interpretive frameworks that influence archaeological practice in the Anglo-American world. Beginning with an overview of major debates in the discipline during the past half-century, Anthro 2070 will go on to consider diverse topics that provide the foundation for the field of archaeology today. The intent is to provide graduate students with a solid foundation in archaeological theory, resulting in an ability to understand, critically assess, and contribute to debates concerning the construction of contemporary archaeological discourse.

Course Note: Required of graduate students in the Archaeology Program of Anthropology; this class is designed for graduate students but enthusiastic and energetic undergraduates are most welcome.

FAS Divisional Distribution: Social Sciences

ANTHRO 2413

Comparative Human Ecologies

Course ID: 226245
2025 Fall (4 Credits)

M 0900 AM - 1145 AM

Shayla Monroe

This course surveys of wide variety approaches to ecological studies in Africa and places them in dialogue with paleoecology and environmental archaeology. We will interrogate the relationships between the following approaches: Ecology in Africa (as an academic discipline), Indigenous Ecological Knowledge in Africa, Paleoecology and Paleoclimatology, Cultural Ecology and Human Behavioral Ecology, Political Ecology, Historical Ecology, De-colonial Ecology and Feminist Ecology. While the geographic focus of the course leans heavily towards African peoples and places, the theoretical scope should be useful to student interest in human-environmental studies anywhere in the world.

FAS Divisional Distribution: Social Sciences

ANTHRO 2722

Sonic Ethnography

Course ID: 108976
2026 Spring (4 Credits)

No meeting time listed

Instructor Permission Required

This is a practice-based course in which students record, edit, and produce anthropologically informed audio works. Students will select a local 'site' where they can safely spend time throughout semester, and where the basic activity of research is stereo audio recording. Given our current spatial dispersion, this semester the focus will be on composing specifically for headphones. Over the course of the semester, listening sessions will provide a broad context of contemporary work using location recordings, and readings will situate the practice in relation to adjacent currents. In their projects, students will experiment with technical and conceptual strategies of recording and composition as they engage with questions of ethnographic representation through the medium of audio.

The instructor for this course will be Ernst Karel.

Experience in media production helpful but not required.

FAS Divisional Distribution: Arts and Humanities

ANTHRO 2797

Theory and Practice of Social Medicine

W 1200 PM - 0245 PM

Salmaan Keshavjee

Course ID: 218184
2025 Fall (4 Credits)

Instructor Permission Required

Social medicine is a field of study and practice that uses insights from the social sciences to improve medical theory and the delivery of health care. This course will explore the historical foundations of social medicine in the 19th and 20th centuries in Europe, Latin America, Asia, Africa, and North America. It will then examine case studies of social medicine in the contemporary world that confront the challenges of post-colonialism, neoliberalism, racism, and care-giving.

Christina Warinner

Course ID: 120488

2026 Spring (4 Credits)

All good research begins with a strong foundation. This course is aimed at providing you with the foundational knowledge and basic tools you need to succeed as a professional working in studies of the human past, including archaeology and adjacent fields. Aided in part by guest speakers from within and beyond Harvard, this course emphasizes collaborative research, presentation, publication, grant proposal writing, conflict resolution, and other skills to help you complete your PhD and to be competitive on the job market afterwards, and to navigate the complex intellectual, social, and personal demands of academia.

Course Note: Anthropology 2070 is commonly taken before Anthropology 3070, but is not a prerequisite. Required of students in the Archaeology Program of Anthropology; open to other graduate students and advanced undergraduates with permission of instructor.

Requires: Course open to Graduate Students Only (Undergraduates can submit a request to enroll)

Research Design/Proposal Writing

T 1200 PM - 0245 PM

Instructor Permission Required

Malavika Reddy

This course is part seminar, part practicum. Its purpose is to help students conceptualize and design a research project, to craft effective research and grant proposals, and to prepare for ethnographic and archival work. The first and longest part of the course will focus on formulating a researchable project, in all its various elements; how to write a statement of problem, to frame arguments/theses, to situate work in the appropriate

anthropological literature/s, to develop a methodological approach, and techniques, commensurate with the objectives and claims of the study, and to make a case for its significance and contribution to the discipline. To the extent time permits, the class will also pursue a secondary objective: imparting professional skills, primarily in the area of writing and publishing, but also in oral presentation, that will be useful to students throughout their professional lives.

Course Note: By permission only. The class is open to third year social anthropology students who have done most of the background reading for their PhD dissertation research and are actively working on a formal research proposal, of which they have a draft in hand.

Requires: Course open to Graduate Students Only (Undergraduates can submit a request to enroll)

FAS Divisional Distribution: Social Sciences

ANTHRO 3636

Pedagogy in Anthropology

T 1030 AM - 1145 AM

Matt Liebmman, Peter Manuelian

This course has two aims: 1) to provide graduate students with the necessary training to be effective Teaching Fellows at Harvard, and 2) to give you the tools to develop your own approach to critical pedagogy in the field of Anthropology. Required for graduate students in the Spring of their second year. Classes will also be advertised to all Anthropology graduate students as optional Pedagogy Workshops for professional development. While discussions will be tailored to the unique challenges of teaching in Anthropology (across Archaeology and Social Anthropology), students will also be prepared to TF outside of Anthropology. Workshop-style classes are interspersed with formal office hours throughout the semester. Office hours are designed for one-on-one or small-group consultation with the Pedagogy Fellow in conjunction with course requirements.

Requires: Course open to Graduate Students Only (Undergraduates can submit a request to enroll)

FAS Divisional Distribution: None

Applied Computation

Applied Computation

APCOMP 209A

Data Science 1: Introduction to Data Science

MW 1030 AM - 1145 AM

Pavlos Protopapas, Kevin A. Rader

Data Science 1 is the first half of a one-year introduction to data science. The course will focus on the analysis of messy, real life data to perform predictions using statistical and machine learning methods. Material covered will integrate the five key facets of an investigation using data: (1) data collection - data wrangling, cleaning, and sampling to get a suitable data set; (2) data management - accessing data quickly and reliably; (3) exploratory data analysis - generating hypotheses and building intuition; (4) prediction or statistical learning; and (5) communication - summarizing results through visualization, stories, and interpretable summaries. Part one of a two part series. The curriculum for this course builds throughout the academic year. Students are strongly encouraged to enroll in both the fall and spring course within the same academic year.

Course Note: Only one of CS 1090a, CS 109a, AC 209a, Stat 109a, or Stat 121a can be taken for credit.

Programming knowledge at the level of CS 50 or above, and statistics knowledge at the level of Stat 100 or above (Stat 110 recommended).

Requires: Not to be taken in addition to Computer Science 1090A, or Statistics 109A, or Statistics 121, or Statistics 121A.

Full Year Course: Divisible Course

Quantitative Reasoning with Data: Yes

FAS Divisional Distribution: Science & Engineering & Applied Science

APCOMP 209B

Data Science 2: Advanced Topics in Data Science

MWF 0945 AM - 1100 AM

Pavlos Protopapas, Alex Young

Course ID: 214587

2026 Spring (2 Credits)

Course ID: 109898

2025 Fall (4 Credits)

Course ID: 203547

2026 Spring (4 Credits)

Data Science 2 is the second half of a one-year introduction to data science. Building upon the material in Data Science 1, the course introduces advanced methods for statistical modeling, representation, and prediction. Topics include multiple deep learning architectures such as CNNs, RNNs, transformers, language models, autoencoders, and generative models as well as basic Bayesian methods, and unsupervised learning. Students are strongly encouraged to enroll in both the fall and spring course within the same academic year. Part two of a two-part series.

Course Note: Can only be taken after successful completion of CS 1090a, CS 109a, AC 209a, Stat 109a, or Stat 121a, or equivalent.

CS 1090a, CS 109a, AC 209a, Stat 109a, or Stat 121a required.

Requires: Requisite: (Must take CS 1090A OR APCOMP 209A OR STAT 109A OR STAT 121A before taking APCOMP 209B) AND (Not to be taken in addition to CS 1090B OR STAT 109B, OR STAT 121 OR STAT 121B)

Quantitative Reasoning with Data: Yes

Full Year Course: Divisible Course

APCOMP 215

Advanced Practical Data Science

TR 1245 PM - 0245 PM

Pavlos Protopapas

Course ID: 215121

2025 Fall (4 Credits)

Instructor Permission Required

The primary objective of this course is to provide a comprehensive understanding of the Deep Learning process in a practical, real-world context. With a strong emphasis on Machine Learning Operations (MLOps), this course not only reviews existing Deep Learning flows, but also enables students to build, deploy, and manage applications that leverage these models effectively. In the rapidly evolving field of data science, merely creating powerful predictive models is not enough. Efficiently deploying and managing these models in production environments - a practice often referred to as MLOps - has become an essential skill. MLOps bridges the gap between the development of Machine Learning (ML) models and their operation in production settings, combining practices from data science, data engineering and software engineering. This course is built upon the model of balancing conceptual understanding, theoretical knowledge, and hands-on implementation. It introduces students to the iterative process of model development, testing, deployment, monitoring, and updating, ensuring they acquire a strong foundation in MLOps principles.

AC 209A, AC 209B

FAS Divisional Distribution: Science & Engineering & Applied Science

APCOMP 221

Critical Thinking in Data Science

MW 0345 PM - 0500 PM

Course ID: 207093

2026 Spring (4 Credits)

This course examines the wide-ranging impact data science has on the world and how to think critically about issues of fairness, privacy, ethics, and bias while building algorithms and predictive models that get deployed in the form of products, policy and scientific research. Topics will include algorithmic accountability and discriminatory algorithms, black box algorithms, data privacy and security, ethical frameworks; and experimental and product design. We will work through case studies in a variety of contexts including media, tech and sharing economy platforms; medicine and public health; data science for social good, and politics. We will look at the underlying machine learning algorithms, statistical models, code and data. Threads of history, philosophy, business models and strategy; and regulatory and policy issues will be woven throughout the course.

Course Note: This does not count as a technical or disciplinary course for SEAS PhD students, nor for SEAS masters-degree students outside of CSE and Data Science.

CS 109A, Introduction to Data Science or equivalent by instructor approval.

FAS Divisional Distribution: Science & Engineering & Applied Science

APCOMP 275

Computational Design of Materials

TR 1030 AM - 1145 AM

Boris Kozinsky

Course ID: 128103

2025 Fall (4 Credits)

This course covers theoretical background and practical hands-on applications of modern computational atomistic methods used to understand and design properties of advanced functional materials. Topics include classical interatomic potentials and machine learning methods, quantum first-principles electronic structure models based on wave functions and density functional theory, Monte Carlo sampling and molecular dynamics simulations of phase transitions and free energies, fluctuations and transport properties. Applications include atomistic and electronic effects in materials for energy conversion and storage, catalysis, alloys, polymers, and low-dimensional materials.

Course Note: Applied Computation 275 is also offered as Applied Physics 275. Students may not take both for credit.

Undergraduate coursework in quantum mechanics and solid-state physics, physical chemistry, linear algebra, thermodynamics and statistical mechanics.

FAS Divisional Distribution: Science & Engineering & Applied Science

APCOMP 297R

Computational Science and Engineering Capstone Project

W 1245 PM - 0330 PM

Weiwei Pan

Course ID: 156202
2025 Fall (4 Credits)

Instructor Permission Required

The capstone course is intended to provide students with an opportunity to work in groups of 3-4 on a real-world project. Students will develop novel ideas while applying and enhancing skills they have acquired from their core courses and electives. By requiring students to complete a substantial and challenging collaborative project, the capstone course will prepare students for the professional world and ensure that they are trained to conduct research. There will be no additional homework. There will be several mini-lectures, focusing on supplemental skills such as technical writing, public speaking, reading research papers, using version control software, identifying biases, etc. Since the projects concern real-world projects, datasets will likely be messy, and there is a focus on effectively communicating your progress to both the staff and partner organization.

Interdisciplinary Seminar in Applied Computation

F 0215 PM - 0330 PM

Weiwei Pan

Course ID: 109339
2025 Fall (2 Credits)

This course examines sources of and mitigation frameworks for social bias in technology (with a special focus on generative AI). We examine social bias in tech in two ways: 1. by examining structural (e.g. cultural, social and institutional) factors underlying the low levels of diversity in decision making roles in technology, and 2. by examining the unequal social impact of technology in deployment. Through readings, students will gain familiarity with a wide range of previously identified structural challenges for achieving equitable representation in tech and fair outcomes when technology is integrated into social institutions. The focus of the course will be on identifying leadership opportunities and concrete strategies for making positive changes in tech communities (both inside and outside classroom) as well as in the way that technology is deployed, used, monitored and governed. In view of the roll-out of the EU AI Act (the world's first horizontal and standalone law governing AI) on August 1st 2024, this semester, we will take a special focus on connecting policy to technical research. Specifically, we will survey

frameworks for discovering and quantifying social bias in ML/AI systems and explore ways that these technical tools can support enforcement of AI regulations. We will anchor our research to concrete goals and principles of the AI Act.

APMTH 10

Computing with Python for Scientists and Engineers

TR 1030 AM - 1145 AM

Logan McCarty

Course ID: 213407

2025 Fall (4 Credits)

This course is a systematic introduction to computing (with python and jupyter notebooks) for science and engineering applications. Applications are drawn from a broad range of disciplines, including physical, financial, and biological-epidemiological problems. The course consists of two parts: 1. Basics: essential elements of computing, including types of variables, lists, arrays, iteration and control flow (for, while loops, if statement), definition of functions, recursion, file handling and simple plots, plotting and visualization tools in higher dimensions. 2. Applications: development of computational skills for problem solving, including numerical and machine learning methods, and their use in deterministic and stochastic approaches; examples include numerical differentiation and integration, fitting of curves and error analysis, solution of simple differential equations, random numbers and stochastic sampling, and advanced methods like neural networks and simulated annealing for optimization in complex systems. Course work consists of attending lectures and labs, weekly homework assignments, a mid-term project and a final project; while work is developed collaboratively, coding assignments are submitted individually.

Course Note: This course satisfies the QRD requirement. Lectures meet concurrently with Physics 20, although sections, homework and project assignments are different between the two courses.

Mathematics 1b is a prerequisite, although it can be taken concurrently (particularly for sophomores). Some limited concepts from Mathematics 21a are used, but they can be learned during the course. The course provides an introduction to programming with a mathematical focus, using Python, and starts from the level of a complete beginner.

APMTH 22A

Solving and Optimizing

MWF 1115 AM - 1230 PM

Steven Gortler

Course ID: 211334

2026 Spring (4 Credits)

This course covers a combination of linear algebra and multivariate calculus with an eye towards solving systems of equations and optimization problems. Students will learn how to prove some key results, and will also implement these ideas with code. Linear algebra: matrices, vector spaces, bases and dimension, inner products, least squares problems, eigenvalues, eigenvectors, singular values, singular vectors. Multivariate calculus: partial differentiation, gradient and Hessian, critical points, Lagrange multipliers.

Course Note: Not to be taken in addition to AM21b or Math21b. Some overlap with AM21a and Math21a. Can be used in conjunction with Stat110 to fulfill the mathematics requirements for computer science.

Mathematics 1b or an equivalent background in mathematics.

Requires: Anti-Req: Cannot be taken for credit if enrolled in or has completed Math 22a.

Quantitative Reasoning with Data: Yes

APMTH 104

Complex and Fourier Analysis with Applications to Art, Science and Engineering

MW 0945 AM - 1100 AM

L. Mahadevan

Course ID: 122094
2025 Fall (4 Credits)

Complex analysis: complex numbers, functions, mappings, Laurent series, differentiation, integration, contour integration and residue theory, conformal mappings. Applications to visualization, art (especially M.C. Escher). Anamorphic images. Fourier Analysis: orthogonality, Fourier Series, Fourier transforms. Signal processing: sampling theorems (Nyquist, Shannon), fast Fourier transforms. Applications to image, audio analysis: filtering and deblurring.

Applied Mathematics 22a and 22b or Mathematics 21a and 21b. MATLAB or PYTHON experience recommended.

FAS Divisional Distribution: Science & Engineering & Applied Science

APMTH 105

Ordinary and Partial Differential Equations

MWF 1030 AM - 1145 AM

Course ID: 143432
2026 Spring (4 Credits)

Margo Levine

Ordinary differential equations: power series solutions; special functions; eigenfunction expansions. Elementary partial differential equations: separation of variables and series solutions; diffusion, wave and Laplace equations. Brief introduction to nonlinear dynamical systems and to numerical methods.

Mathematics 1b, Mathematics 21a and 21b.

FAS Divisional Distribution: Science & Engineering & Applied Science

APMTH 106

Algebra for Models and Data

MW 0300 PM - 0415 PM

Anna Seigal

This course is an introduction to abstract algebra and its applications. Topics will include rings, polynomials, and ideals, factorization of matrices and polynomials, exact and numerical algorithms for solving equations, and applications to data analysis, modeling, and optimization.

Course Note: Not recommended for students who have taken Mathematics 122 or Mathematics 55a.

Familiarity with linear algebra (at the level of Math 21b) and proofs (at the level of Math 22a, Math 101, or CS 20). Programming experience is helpful but not required.

FAS Divisional Distribution: Science & Engineering & Applied Science

APMTH 107

Graph Theory and Combinatorics

TR 0945 AM - 1100 AM

Leslie Valiant

Topics in combinatorial mathematics that find frequent application in computer science, engineering, and general applied mathematics. Course focuses on graph theory on one hand, and enumeration on the other. Specific topics include graph matching and graph coloring, generating functions and recurrence relations, combinatorial algorithms, and discrete probability. Emphasis on problem solving and proofs.

FAS Divisional Distribution: Science & Engineering & Applied Science

APMTH 108

Nonlinear Dynamical Systems

MWF 0130 PM - 0245 PM

Sarah Iams

An introduction to nonlinear dynamical phenomena, focused on identifying the long term behavior of systems described by ordinary differential equations. The emphasis is on stability and parameter dependence (bifurcations). Other topics include: chaos; routes to chaos and universality; maps; strange attractors; fractals. Techniques for analyzing nonlinear systems are introduced with applications to physical, chemical, and biological systems such as forced oscillators, chaotic reactions, and population dynamics.

Mathematics 1b, 21a, and 21b.

FAS Divisional Distribution: Science & Engineering & Applied Science

APMTH 109

Introduction to PDEs and their Applications

TR 1030 AM - 1145 AM

Nick Trefethen

This course serves as an introduction to partial differential equations (PDE) and their applications across the sciences. The course will familiarize students with the process of starting with a model, deriving the appropriate PDE, and solving it. Examples include wave equations, diffusion equations, the Laplace equation, and several nonlinear equations such as the Burgers and KdV equations. To build intuition for the analytical solutions, simple

numerical simulations will be utilized.

Requires: Pre-Requisite: APMTH 105

FAS Divisional Distribution: Science & Engineering & Applied Science

APMTH 111

Introduction to Scientific Computing

TR 1200 PM - 0115 PM

Sarah Iams

Many science and engineering problems don't have simple analytical solutions or even accurate analytical approximations. Scientific computing can address certain of these problems successfully, providing unique insight. This course introduces some of the widely used techniques in scientific computing through examples chosen from physics, chemistry, biology, computer science and other fields. The purpose of the course is to introduce methods that are useful in applications and research and to give the students hands-on experience with these methods. The main programming language will be Python.

Course Note: Applied Mathematics 111 is also offered as Engineering Sciences 111. Students may not take both for credit. Undergraduate Engineering Students should enroll in Engineering Sciences 111.

Mathematics 1b, 21a, and 21b

Requires: Pre Req: APMTH 10, COMPSI 32, or COMPSI 50.

Anti-Req: Students may not take APMTH/ES 111 after APMTH 205 or simultaneously with APMTH 205.

FAS Divisional Distribution: Science & Engineering & Applied Science

APMTH 115

Mathematical Modeling

TR 1030 AM - 1145 AM

Michael P. Brenner

Abstracting the essential components and mechanisms from a natural system to produce a mathematical model, which can be analyzed with a variety of formal mathematical methods, is perhaps the most important, but least understood, task in applied mathematics. This course approaches a number of problems without the prejudice of trying to apply a particular method of solution. Topics drawn from biology, economics, engineering, physical and social sciences.

Course Note: Applied Mathematics 115 is also offered as Engineering Sciences 115. Students may not take both for credit. Undergraduate Engineering Students should enroll in Engineering Sciences 115.

Prerequisite: Applied Mathematics 21a and 21b, or Mathematics 21a and 21b or permission of instructor. Taking APMTH 105 OR APMTH 108 OR APMTH 104 OR MATH 112 OR STAT 110 before taking APMTH 115 is recommended but not required.

Applied Linear Algebra and Big Data

TR 0130 PM - 0245 PM

Eli Tziperman

Topics in linear algebra that frequently arise in applications, especially in the analysis of large data sets: linear equations, eigenvalue problems, linear differential equations, principal component analysis, singular value decomposition; data mining and machine learning methods: clustering (unsupervised learning) and classification (supervised) using neural networks and random forests. Examples from physical sciences, biology, climate, commerce, the internet, image processing, and more will be given. The approach is application-motivated, focusing on an intuitive understanding of the algorithms behind these methods obtained by analyzing small data sets. Programming assignments can be done using Python or Matlab.

Mathematics 21a,b or equivalent, Computer Science 50 or Applied Mathematics 10 or equivalent programming experience.

Quantitative Reasoning with Data: Yes

FAS Divisional Distribution: Science & Engineering & Applied Science

APMTH 121

Introduction to Optimization: Models and Methods

MWF 1200 PM - 0115 PM

Margo Levine

This course provides an introduction to basic mathematical ideas and computational methods for optimization. Topics include linear programming, integer programming, branch-and-bound, branch-and-cut, as well as first-order gradient-based methods with an emphasis on modeling and data science applications.

Course Note: Applied Mathematics 121 is also offered as Engineering Sciences 121. Students may not take both for credit. Undergraduate Engineering Students should enroll in Engineering Sciences 121.

Mathematics 21b or equivalent preparation in linear algebra. Basic programming.

FAS Divisional Distribution: Science & Engineering & Applied Science

APMTH 158

Introduction to Optimal Control and Reinforcement Learning

MW 0215 PM - 0330 PM

Heng Yang

This course covers optimal control and reinforcement learning for dynamical systems, with a strong emphasis on robotic applications such as quadrupeds and humanoids. The first half focuses on optimal control for systems with known, potentially nonlinear dynamics. Students will learn the fundamentals of dynamic programming and the linear quadratic regulator (LQR) before delving into trajectory optimization and model predictive control (MPC) for nonlinear systems, which emphasizes numerical optimization techniques for synthesizing complex motions. The second half explores reinforcement learning (RL) for systems with unknown dynamics. Topics include both model-free and model-based RL algorithms such as proximal policy optimization (PPO), actor-critic methods, and model-based policy optimization, with a focus on continuous state and action spaces. Additional topics may include Lyapunov analysis, vision-based feedback control, and advanced convex optimization. The course prioritizes computational algorithms over theoretical analysis, equipping students with practical tools for solving complex control problems. Assignments involve programming in Python and MATLAB to control simulated dynamical systems in MuJoCo and other environments.

Course Note: Applied Mathematics 158 is also offered as Engineering Sciences 158. Students may not take both for credit. Undergraduate Engineering Students should enroll in Engineering Sciences 158.

Familiarity with linear algebra, probabilistics, calculus, and programming (Matlab, Python, etc.). Knowledge about control theory (ES 155) and optimization (AM/ES 121) is recommended.

Course ID: 222513
2025 Fall (4 Credits)

Algebraic Fundamentals of Representing Data

TR 0130 PM - 0245 PM

Anna Seigal

Algebra gives mathematical abstractions that allow us to process information. Many optimization problems in data and learning are built on algebraic ideas. For example, principal component analysis finds a low rank approximation of a matrix, a problem central to linear algebra. This course builds out from this example to study the algebraic fundamentals of optimization problems to find representations of data. The course combines mathematical theory, computational experiments, and exploration of data. The focus is on current research developments and connections to open problems. By the end, students will have a unified algebraic toolbox to understand existing methods, to design new models, and to prove results on their theoretical underpinnings.

This is a graduate course in applied algebra. The course combines mathematical theory, computational and

numerical experiments, and exploration of real world data. The focus is on current research developments and connections to open problems. Recommended preparation for the course is familiarity with proofs in linear algebra at the level of two semesters of Math 22A/B or Math 25A or Math 121 as well as programming experience at the level of AM 120.

FAS Divisional Distribution: Science & Engineering & Applied Science

APMTH 215

Mathematical Modeling for Computational Science

TR 1030 AM - 1145 AM

Michael P. Brenner

Course ID: 225020
2025 Fall (4 Credits)

Instructor Permission Required

Mathematical modeling is the essential component of the revolution in computation-based research over the past decade. While designing mathematical models is itself an art form, it is equally important to learn how to transform them into computational systems that allow robust evaluation, which is critical for real-world use cases, from modeling the spread of COVID, to designing better large language models. This course introduces mathematical modeling ideas while teaching how to transform them into robust computational frameworks for model evaluation and deployment, as done in industry. The aim is to give both a broad view of "what a mathematical model" is and, at the same time, to teach the core computational skills for building usable state-of-the-art models. Topics drawn from biology, economics, engineering, physical and social sciences.

Course Note: This class is taught in parallel to the undergraduate class Applied Math 115. Preference will be given to Data Science and CSE SM Students and then other graduate students.

Computer programming background. Statistics 110, Applied Mathematics 105.

FAS Divisional Distribution: Science & Engineering & Applied Science

APMTH 226

Theory of Neural Computation

MW 0900 AM - 1015 AM

Cengiz Pehlevan

Course ID: 212912
2025 Fall (4 Credits)

This course is an introduction to the theory of computation with artificial and biological neural networks. We will cover selected topics from theoretical neuroscience and deep learning theory with an emphasis on topics at the research frontier. These topics include expressivity and generalization in deep learning models; infinite-width limit of neural networks and kernel machines; deep learning dynamics; biologically-plausible learning and models of synaptic plasticity; reinforcement learning in the brain; neural population codes; normative theories of sensory representations; attractor network models of memory and spatial maps; sequential processing with recurrent neural networks and transformers; generative modeling.

Math 21A and Math 21B or equivalent.

APMTH 230

Active Matter

F 0300 PM - 0545 PM

L Mahadevan

Course ID: 220128
2026 Spring (4 Credits)

Instructor Permission Required

Active matter describes out of equilibrium systems that consume energy to do work and become functional. Understanding their behavior and function has implications for biology and complex systems across scales, from cells to ecosystems, e.g., morphogenesis, collective behavior of flocks and herds, neurodynamics of locomotion, etc. The tools and concepts needed include non-equilibrium statistical mechanics, kinetic theory, soft matter, and hydrodynamics; methods for the analysis of the models include scaling, coarse-graining (homogenization, renormalization) and computational algorithms (for stochastic and deterministic DE). This course will provide an introduction to the questions, techniques and successes of this exploding field that cuts across the physical and biological sciences.

Course Note: Open to PhD students and [AB/SM students or advanced undergraduate students] by permission of instructor. Applied Math 230 is also offered as Physics 230. Students may not take both for credit.

Applied Mathematics 105, Applied Mathematics 201, Physics 153, Physics 181, Engineering Sciences 220, Engineering Sciences 240, or equivalent.

Requires: PHDs Only

APMTH 231

Decision Theory

TR 1115 AM - 1230 PM

Demba Ba

Course ID: 203548

2026 Spring (4 Credits)

Instructor Permission Required

ES 201/AM 231 is a course in statistical inference and estimation from a signal processing perspective. The course will emphasize the entire pipeline from writing a model, estimating its parameters and performing inference utilizing real data. The first part of the course will focus on linear and nonlinear probabilistic generative/regression models (e.g. linear, logistic, Poisson regression), and algorithms for optimization (ML/MAP estimation) and Bayesian inference in these models. We will pay particular attention to sparsity-induced regression models, because of their relation to artificial neural networks, the topic of the second part of the course. The second part of the course will introduce students to the nascent and exciting research area of model-based deep learning. At present, we lack a principled way to design artificial neural networks, the workhorses of modern AI systems. Moreover, modern AI systems lack the ability to explain how they reach their decisions. In other words, we cannot yet call AI explainable or interpretable which, as a society, poses important questions as to the responsible use of such technology. Model-based deep learning provides a framework to develop and constrain neural-network architectures in a principled fashion. We will see, for instance, how neural networks with ReLU nonlinearities arise from sparse probabilistic generative models introduced in the first part of the course. This will form the basis for a rigorous recipe we will teach you to build interpretable deep neural networks, from the ground up. We will invite an exciting line up of speakers. Time permitting, we will provide a model-based perspective of the building blocks of modern language and image generative models.

Course Note: Engineering Sciences 201 is the same as Applied Mathematics 231. Students may not take both for credit.

Applied Mathematics 21a,b or Mathematics 21a,b, and Statistics 110 or equivalents.

FAS Divisional Distribution: Science & Engineering & Applied Science

Quantitative Reasoning with Data: Yes

APMTH 232

Learning, Estimation, and Control of Dynamical Systems

MW 0945 AM - 1100 AM

Na Li

Course ID: 161259

2026 Spring (4 Credits)

This graduate level course studies dynamic systems in time domain with inputs and outputs. Students will learn how to design estimator and controller for a system to ensure desirable properties (e.g., stability, performance, robustness) of the dynamical system. In particular, the course will focus on systems that can be modeled by linear ordinary differential equations (ODEs) and that satisfy time-invariance conditions. The course will introduce the fundamental mathematics of linear spaces, linear operator theory, and then proceeds with the analysis of the response of linear time-variant systems. Advanced topics such as robust control, model predictive control, linear quadratic games and distributed control will be presented based on allowable time and interest from the class. The material learned in this course will form a valuable foundation for further work in systems, control, estimation, identification, detection, signal processing, and communications.

Course Note: Applied Mathematics 232 is also offered as Engineering Sciences 202. Students may not take both for credit.

Linear algebra, differential equations, and signals and systems (AM 120, ES 156, or equivalent). Undergraduates need permission.

FAS Divisional Distribution: Science & Engineering & Applied Science

APMTH 254

Mathematics of High-Dimensional Information Processing and Learning

TR 1200 PM - 0115 PM

Yue Lu

Course ID: 160447

2025 Fall (4 Credits)

Instructor Permission Required

This course introduces students to fundamental results and recently developed techniques in high-dimensional probability theory and statistical physics that have been successfully applied to the analysis of information processing and machine learning problems. Discussions will be focused on studying such problems in the high-dimensional limit, on analyzing the emergence of phase transitions, and on understanding the scaling limits of efficient algorithms. This course seeks to start from basics, assuming just a solid understanding of

undergraduate probability theory. Students will take an active role by exploring and applying what they learn from the course to their own research problems.

Course Note: Applied Mathematics 254 is also offered as Engineering Sciences 254. Students may not take both for credit.

Analysis (Math 21a/b, or equivalent), Probability (Statistics 110, Engineering Sciences 150, or equivalent), and Programming (Python, Julia, or Matlab).

Applied Physics

Applied Physics

APPHY 50A**Physics as a Foundation for Science and Engineering, Part I**

TR 0945 AM - 1230 PM

Julia Mundy, Kelly Miller

Course ID: 108880

2025 Fall (4 Credits)

Instructor Permission Required

AP 50A is the first half of a year-long, team- and project-based introduction to physics focusing on the application of physics to real-world problems. The AP 50A and B sequence, designed for engineering and physics concentrators, is equivalent in content and rigor to a standard calculus-based introductory physics course sequence. Lectures and exams are replaced by interactive, hands-on, and collaborative learning activities that will not only help you master physics concepts and hone your scientific reasoning and problem-solving skills, but also grow your capacity for self-directed learning and develop your collaborative skills. Course Content: Kinematics, mechanics, waves

Course Note: The assigned course time (Tu/Th 9:45 am to 12:30 pm) includes regular class activities, section activities, and time for project work. There are no other sections or laboratories.

Physics prerequisite: None. Prior physics at the high-school or college level not required. Math prerequisite: Single-variable calculus at the level of Mathematics 1b (can be taken concurrently). You should be comfortable performing basic derivatives and integrals of a single variable.

Quantitative Reasoning with Data: Yes

FAS Divisional Distribution: Science & Engineering & Applied Science

APPHY 50B**Physics as a Foundation for Science and Engineering, Part II**

TR 0945 AM - 1230 PM

Kelly Miller, Doeke Hekstra

Course ID: 108882

2026 Spring (4 Credits)

Instructor Permission Required

AP 50B is the second half of a year-long, team- and project-based introduction to physics focusing on the application of physics to real-world problems. The AP 50A and B sequence, designed for engineering and physics concentrators, is equivalent in content and rigor to a standard calculus-based introductory physics course sequence. Lectures and exams are replaced by interactive, hands-on, and collaborative learning activities that will not only help you master physics concepts and hone your scientific reasoning and problem-solving skills, but also grow your capacity for self-directed learning and develop your collaborative skills. Course Content: Electromagnetism and optics

Course Note: The assigned course time (Tu/Th 9:45 am to 12:30 pm) includes regular class activities, section activities, and time for project work. There are no other sections or laboratories.

Physics prerequisite: AP50a or equivalent. Math prerequisite: Multivariable calculus at the level of Mathematics 21a (can be taken concurrently). You should be comfortable performing basic vector calculus, including line and surface integrals.

FAS Divisional Distribution: Science & Engineering & Applied Science

APPHY 195A**Introduction to Solid State Physics**

MW 0300 PM - 0415 PM

Jenny Hoffman

Course ID: 131331

2025 Fall (4 Credits)

The physics of crystalline solids and their electric, magnetic, optical, and thermal properties. Designed as a first course in solid-state physics. Topics: free electron model; Drude model; the physics of crystal binding; crystal structure and vibration (phonons); x-ray diffraction; electrons in solids (Bloch theorem) and electronic band structures; metals and insulators; semiconductors (and their applications in pn junctions and transistors);

magnetism; superconductivity.

Course Note: APPHY 195A is also offered as PHYSICS 195A. Students may not take both for credit.

Physics 15a, 15b and 15c or the equivalent. Physics 143a. Physics 181 and Physics 143b (taken concurrently) helpful but not required.

FAS Divisional Distribution: Science & Engineering & Applied Science

APPHY 195B

Introduction to Quantum Materials and Devices

MWF 0300 PM - 0415 PM

Robert Westervelt

This course provides an introduction to quantum materials and devices, including low-dimensional materials, single and double quantum dots, Josephson junctions, and graphene. Their behavior is explained using quantum and semiclassical transport, the Coulomb blockade, and superconductivity. Quantum devices offer new approaches for electronics and photonics.

Course Note: Formerly AP 171 and ENGSCI 171. Applied Physics 195B is also offered as Physics 195B. Students may not take both for credit.

Applied Physics 195A or Physics 195A, and Physics 143A or ES 170.

FAS Divisional Distribution: Science & Engineering & Applied Science

APPHY 216

Quantum and Classical Electromagnetic Interaction with Matter

MW 0130 PM - 0245 PM

Donhee Ham

The first half of the course will cover the interaction of quantized atoms with electromagnetic fields, introducing a number of basic concepts such as coherent Rabi transitions vs. rate-equation dynamics, stimulated & spontaneous transitions, and energy & phase relaxations. These will be then used to study a range of applications of atom-field interactions, such as nuclear magnetic resonance, molecular beam and paramagnetic masers, passive and active atomic clocks, dynamic nuclear polarization, pulse sequence techniques to coherently manipulate atomic quantum states, and laser oscillators with applications. We will also touch upon the interaction of quantized atoms with quantized fields, discussing the atom + photon (Jaynes-Cummings) Hamiltonian, dressed states, and cavity quantum electrodynamics. The second half will cover the classical interaction of electromagnetic fields with matter, with special attentions to collective electrodynamics in particular, magnetohydrodynamics and plasma physics with applications in astrophysics, space physics, and Bloch electrons in crystalline solids.

Undergraduate-level electromagnetism and quantum mechanics are recommended.

FAS Divisional Distribution: Science & Engineering & Applied Science

APPHY 218

Electrical, Optical, and Magnetic Properties of Materials

TR 1200 PM - 0115 PM

Robert Westervelt

This course covers the electrical, optical and magnetic properties of technologically important materials. It provides a quantitative description of their functional properties including dielectric, ferroelectric, and piezoelectric behavior, and their paramagnetic and ferromagnetic states. Electronic characteristics of semiconductors, dielectric materials, and superconductors will be covered, as well as the optical response including birefringence, Pockels effect, Kerr effect, and photoelasticity. In addition, special topics related to recent research will be addressed.

Solid-state physics or equivalent course.

FAS Divisional Distribution: Science & Engineering & Applied Science

Course ID: 141253
2026 Spring (4 Credits)

Course ID: 121594
2025 Fall (4 Credits)

Introduction to Soft Matter

TR 1030 AM - 1145 AM

David Weitz

This course will present a survey of soft matter physics, providing an overview of the richness and breadth of the field. The emphasis will be on the physics of the systems, rather than on the formalism. It will cover most of the fields of interest within soft matter physics, both current and through the history of the field. The course is intended to be of value to both experimentalists and theorists.

Applied Physics 284 or Physics 262. Knowledge of basic thermodynamics, statistical mechanics and differential equations.

FAS Divisional Distribution: Science & Engineering & Applied Science

Chemistry in Materials Science and Engineering

MW 0215 PM - 0330 PM

*Instructor Permission Required**Joanna Aizenberg*

Select topics in materials chemistry, focusing on chemical bonds, crystal chemistry, organic and polymeric materials, hybrid materials, surfaces and interfaces, self-assembly, electrochemistry, biomaterials, and bio-inspired materials synthesis.

Introductory thermodynamics, chemistry or equivalent.

FAS Divisional Distribution: Science & Engineering & Applied Science

Physical Electrochemistry and its Applications to Sustainable Engineering

MW 1030 AM - 1145 AM

Zachary Schiffer

This course introduces electrochemical systems through the lens of thermodynamics, kinetics, and transport. We begin by asking what fundamental role an electron plays in a chemical reaction, then we move to methods to treat electrons through traditional chemical kinetic theories, and last, we discuss entire systems and how mass transport affects chemistry. Throughout the course, we will focus on examples from industry, and we will finish by combining all the above into a discussion on electrochemical interfaces in some practical systems.

Students should have had a year of introductory physics (e.g., APPHY 50a/b or PHYSCI 12a/b or Physics 15a or equivalent), an undergraduate general chemistry course (e.g., PS 11), an introductory classical thermodynamics course (e.g., ES 181, ES 112 or CHEM 161), and some form of introduction to mass transport that covers diffusion (e.g., ES 123).

FAS Divisional Distribution: Science & Engineering & Applied Science

Computational Design of Materials

TR 1030 AM - 1145 AM

Boris Kozinsky

This course covers theoretical background and practical hands-on applications of modern computational atomistic methods used to understand and design properties of advanced functional materials. Topics include classical interatomic potentials and machine learning methods, quantum first-principles electronic structure models based on wave functions and density functional theory, Monte Carlo sampling and molecular dynamics simulations of phase transitions and free energies, fluctuations and transport properties. Applications include atomistic and electronic effects in materials for energy conversion and storage, catalysis, alloys, polymers, and low-dimensional materials.

Course Note: Applied Physics 275 is also offered as Applied Computation 275. Students may not take both for credit.

Undergraduate coursework in quantum mechanics and solid-state physics, physical chemistry, linear algebra,

APPHY 276

Platforms for Quantum Science

TR 1200 PM - 0115 PM

Giulia Semeghini

The course introduces various aspects of quantum science, including quantum computing, quantum simulation, quantum communication and quantum metrology. It will particularly focus on the presentation of different experimental platforms currently used in the field and include superconducting qubits, trapped ions, neutral atoms, defects in solids, photons, among others. The course will cover an introduction of the general goals and essential prerequisites for these platforms; it will elucidate their operational principles and highlight some of their most significant and recent achievements, as well as the main challenges in their development.

Quantum mechanics at the level of introductory graduate courses.

Course ID: 223996
2026 Spring (4 Credits)

APPHY 282

Solids: Structure and Defects

TR 0900 AM - 1015 AM

Frans Spaepen

Bonding, crystallography, diffraction, phase diagrams, microstructure, point defects, dislocations, and grain boundaries.

Course Note: Intended for students in applied mechanics, materials science, condensed matter physics, chemistry, and earth sciences. Offered every other year.

FAS Divisional Distribution: Science & Engineering & Applied Science

Course ID: 142998
2025 Fall (4 Credits)

APPHY 284

Statistical Mechanics

MWF 1200 PM - 0115 PM

SueYeon Chung, Sunghan Ro

Basic principles of statistical physics with applications including: the equilibrium properties of classical and quantum gases; phase diagrams, phase transitions and critical points, as illustrated by the gas-liquid transition and simple magnetic models; Bose-Einstein condensation.

Course Note: Also offered as Physics 262. Either course can be used to satisfy the statistical mechanics requirement in the Physics PhD program or the Applied Physics model PhD program.

Physics 143a and Physics 181 or Engineering Sciences 181.

FAS Divisional Distribution: Science & Engineering & Applied Science

Course ID: 131392
2025 Fall (4 Credits)

APPHY 286

Inference, Information Theory, Learning and Statistical Mechanics

TR 0130 PM - 0245 PM

Sharad Ramanathan

This course focuses on the modern applications of Statistical Mechanics. We will learn the basics of information theory, coding and compression. We will next learn about Bayesian Inference, priors and maximizing entropy, which will naturally lead us to regularization and compressed sensing. We will then cover learning: support vector machines, vc dimension, supervised, reinforcement and unsupervised learning. These topics, which build on each other, will be taught using examples in the primary literature with an emphasis on applying the framework we develop. Applications will be taught through problems in genomics, neuroscience, geophysics, and engineering.

Course Note: Applied Physics 286 is also offered as Physics 286. Students may not take both for credit.

Course ID: 212685
2025 Fall (4 Credits)
Instructor Permission Required

Comfort with Linear Algebra, Calculus is necessary, undergraduate Statistical Mechanics would be useful but not necessary.

FAS Divisional Distribution: Science & Engineering & Applied Science

APPHY 290A

Research Practices and Academic Culture in Applied Sciences and Engineering

R 0300 PM - 0500 PM

Course ID: 225969
2026 Spring (2 Credits)

This course supports new PhD students in finding their research fit, building good research habits, and becoming a researcher. It consists of two 2-unit courses: 290a (spring of G1 year) focuses on adapting to a research group, developing strong reading and writing habits, and preparing students for teaching during their G2 year; 290b (fall of G2 year) focuses on oral communication and on preparing students for the qualifying exam. This course also develops other skills necessary for success in graduate school such as setting goals, peer feedback, research ethics, collaboration and teamwork, and negotiation.

Course Note: This course is open and optional for all SEAS G1 PhD students outside CS (CS PhD students should take CS 2901/2902). This course can only count as a 'breadth course' towards SEAS PhD requirements.

Requires: Pre-requisite: Open to first year Applied Mathematics, Applied Physics, or Engineering Sciences students only

FAS Divisional Distribution: None

APPHY 290B

Research Practices and Academic Culture in Applied Sciences and Engineering

R 0300 PM - 0500 PM

David Weitz, Vinothan Manoharan, John Girash

G3-year students in Applied Mathematics, Applied Physics, or Engineering Sciences who have not yet taken the qualifying exam may also enroll for fall 2025.

Requires: Pre-requisite: Open to second year Applied Mathematics, Applied Physics, or Engineering Sciences students only

FAS Divisional Distribution: None

APPHY 291

Electron Microscopy Laboratory

M 0130 PM - 0245 PM

David Bell

Course ID: 116509
2026 Spring (4 Credits)

Instructor Permission Required

Lectures and laboratory instruction on transmission electron microscopy (TEM) and Cs corrected, aberration-correction microscopy and microanalysis. Lab classes include; diffraction, dark field imaging, X-ray spectroscopy, electron energy-loss spectroscopy, atomic imaging, materials sample preparation, polymers, and biological samples.

Course Note: Primarily for graduate students planning to use TEM for their research.

FAS Divisional Distribution: Science & Engineering & Applied Science

APPHY 295A

Introduction to Quantum Theory of Solids

Course ID: 143855
2025 Fall (4 Credits)

MWF 1200 PM - 0115 PM

Philip Kim

Lattices and symmetries. Electronic Structure of Crystals. Semiclassical Transport Theory. Semiconductors. Localization. Integer Quantum Hall effect. Topological Insulators. Phonons. Additional topics from the theory of interacting electrons, including introduction to magnetism and superconductivity.

Course Note: Also offered as Physics 295a. Students may not take both for credit.

One course on graduate quantum mechanics and one course on graduate statistical mechanics. Undergraduate course on solid state physics helpful, but not necessary.

FAS Divisional Distribution: Science & Engineering & Applied Science

APPHY 295B

Quantum Theory of Solids

W 0300 PM - 0545 PM

Ashvin Vishwanath

A course on the application of the principles of many-particle quantum mechanics to the properties of solids. The objective is to make students familiar with the tools of second quantization and diagrammatic perturbation theory, while describing the theory of the electron liquid, the BCS theory of superconductivity, and theory of magnetism in metals and insulators. Modern topics on correlated electron systems will occupy the latter part of the course.

Course Note: Applied Physics 295b is also offered as Physics 295b. Students may not take both for credit.

Physics 251a,b, an introductory course in solid state physics, or permission of instructor.

FAS Divisional Distribution: Science & Engineering & Applied Science

APPHY 296

Mesoscale and Low Dimensional Devices

TR 0130 PM - 0245 PM

Donhee Ham

Concepts of condensed matter physics are applied to the science and technology of beyond-CMOS devices, in particular, mesoscale, low-dimensional, and superconducting devices. Topics include: quantum dots/wires/wells and two-dimensional (2D) materials; optoelectronics with confined electrons; conductance quantization, Landauer-Buttiker formalism, and resonant tunneling; magneto oscillation; integer and fractional quantum Hall effects; Berry phase and topology in condensed matter physics; various Hall effects (anomalous, spin, valley, etc.); Weyl semimetal; topological insulator; spintronic devices and circuits; collective electron behaviors in low dimensions and applications; Cooper-pair boxes and superconducting quantum circuits.

Course Note: Also offered as Physics 296 and QSE 296. Students may only take one of AP 296, Physics 296, and QSE 296 for credit.

Undergrad level condensed matter physics (AP/P195).

APPHY 299QR

Special Topics in Applied Physics (2-unit version)

No meeting time listed

Federico Capasso

Course ID: 218911

2025 Fall (2 Credits)

Instructor Permission Required

Experimental or theoretical research project on acceptable problems in applied mathematics supervised by a SEAS faculty member, and/or supervised reading on topics not covered by regular courses of instruction. The project or reading must be arranged between the student and individual SEAS faculty supervisor prior to enrolling in the course.

Course Note: 2-unit version of AP 299r. Open to graduate students and AB/SM candidates only. In addition to enrolling in my.harvard, enrollees must file a 299r Special Topics Form approved by the SEAS faculty supervisor of the project before the course registration deadline. AB/SM students must obtain CHD approval for this course to count toward their SM requirements, and the course must be allocated accordingly in the student's record with the Registrar; it cannot be used towards also meeting AB degree requirements. The form may be obtained at <https://www.seas.harvard.edu/office-academic-programs/graduate-policies-procedures-and-forms/graduate-student-forms>. Contact gradprograms@seas.harvard.edu if you have any questions.

Exploring the Human Form: An Introduction to Figure Drawing

F 1200 PM - 0415 PM

Course ID: 222793

2026 Spring (4 Credits)

Instructor Permission Required

In this introductory figure drawing course, you'll embark on a structured and guided journey of exploration into the world of figure drawing. Through direct observation of a live nude model, you will progressively establish a strong foundation in the fundamentals of life drawing and approach. The course is designed around a series of assigned projects that will challenge you to address both technical and conceptual aspects of figure drawing. You will be encouraged to view the human body as a source of artistic exploration, fostering a deeper understanding of its form and expressive potential.

The instructor of this course is Maria Gamboa.

FAS Divisional Distribution: Arts and Humanities

AFVS 13 (1)

ASCO: Drawing as Intervention

F 1200 PM - 0415 PM

Course ID: 226383

2025 Fall (4 Credits)

Instructor Permission Required

ASCO, Spanish for "Disgust" or "Nausea," evokes discomfort—an apt name for the Chicano art collective whose subversive performances and interventions challenged cultural invisibility and institutional exclusion in 1970s East Los Angeles. Rejecting artistic boundaries, ASCO transformed drawing into an act of resistance, using murals and graffiti, printmaking, photography, performance, and installation to reclaim space and disrupt dominant narratives. This course takes ASCO's radical defiance as a starting point for an interdisciplinary exploration of drawing as both a visual and conceptual practice. While ASCO's legacy is central, we will also examine the broader Chicano art movement, its key figures, and its ongoing influence on contemporary artistic and activist practices. Expanding traditional notions of mark-making, we will investigate drawing's role in activism, public engagement, and self-representation through experimental approaches including collage, ephemeral media, and performative gestures.

Course Note: Open to students of all disciplines and experience levels, this course encourages risk-taking, critical engagement, and a reimagining of drawing's possibilities in contemporary discourse.

The instructor of this course is Maria Gamboa. FALL 2025: To enroll in this class, visit the course web site for instructions BEFORE sending a petition via my.harvard.

Introduction to Photography

R 0130 PM - 0545 PM

Keisha Scarville

Course ID: 224455

2026 Spring (4 Credits)

Instructor Permission Required

This studio course will introduce you to the conceptual and artistic potential of photography. Your understanding and use of the medium will be contextualized within contemporary and historic photographic art practices. Your own art practice will be developed alongside technical skills. We will discuss topics such as the ethics of photographing people, how to make meaningful images amid the proliferation of digital images, and traits that are unique to photography. This class is organized around presentations on artists' work, presentations on photographic concepts, studio assignments, individual meetings with the instructor and breakout meetings with

peers to develop your practice, technical skill workshops, readings, reading discussions, group critiques, and visiting artist presentations.

Course Note: The instructor of this course is Keisha Scarville.

Curiosity and a strong work ethic are required. No prior visual art studio experience is necessary for enrollment in this class.

Introduction to Nonfiction Videomaking

MW 0900 AM - 1145 AM

Instructor Permission Required

Joana Pimenta

This course is an introduction to documentary filmmaking. We will explore a range of approaches to nonfiction filmmaking through assignments which encompass video and sound recording and editing, cinematography and montage. Following a series of introductory nonfiction camera, sound and editing exercises, both individual and collaborative, designed to introduce and explore the range of expressive possibilities in digital video, each student will spend the semester making a single nonfiction film on a subject of their choice. Class time will include technical workshops, film screenings, discussions of student work and occasional visiting filmmakers.

AFVS 53AR
Fundamentals of Animation

Course ID: 110676
2025 Fall (4 Credits)

W 1200 PM - 0415 PM

Embodied Practices: Coding and Interactivity for Artists

Course ID: 224441
2025 Fall (4 Credits)

T 1200 PM - 0415 PM

Instructor Permission Required

Pascale Tétrault

This course serves as a practical introduction to the world of programming and electronic arts, emphasizing the use of open-source software and hardware. Utilizing platforms like Arduino and Processing, students will learn how to craft systems, circuits, and tools allowing them to create experimental videos, films, installations or sculptures. The curriculum merges on-screen and off-screen experimentations, bridging together notions of programming, electronics, and artistry. Using code and electronic components, students will learn how to physically animate sculptures or characters with motors and lights. By the semester's end, students will have acquired the skills to write code snippets and assemble electronic circuits independently.

Course Note: The instructor of this course is Pascale Tétrault.

There will be film screenings on Fridays from 12pm-2pm on selected weeks throughout the semester.

The instructor of this course is Pascale Tétrault. FALL 2025: To enroll in this class, visit the course web site for instructions BEFORE sending a petition via my.harvard.

AFVS 60X
Approaching Narrative: Introduction to Fiction Filmmaking

Course ID: 127469
2025 Fall (4 Credits)

TR 0900 AM - 1145 AM

Instructor Permission Required

In this production course, students will learn the basic principles of narrative filmmaking, experiment with the visual language of cinema, and push the boundaries of their own moving image work. Students will be introduced to the aesthetic and formal elements of cinema and the terminology of film production. Techniques explored include cinematography, sound recording, and editing. In-class screenings and lectures will give an overview of different modes of filmmaking, including narrative, documentary, and experimental. Students will hone their powers of observation, communicate visual ideas with clarity and simplicity, explore personal storytelling, and develop the ability to read films as trained and informed viewers. Classes will consist of weekly critiques of student work. By the end of the course, students will be equipped with the necessary tools to produce two short 5-7 minute films with sync sound.

Course Note: No prior filmmaking experience necessary.

The instructor of this course is Mamadou Dia. FALL 2025: To enroll in this class, visit the course web site for instructions BEFORE sending a petition via my.harvard.

AFVS 61 (1)

Sight and Sound: Introduction to Narrative Filmmaking

TR 0300 PM - 0545 PM

Course ID: 224547
2026 Spring (4 Credits)

Instructor Permission Required

A practice based course in which students are introduced to the fundamentals of visual and aural story-telling. During the semester the class will explore techniques of cinematographic production including camerawork, sound recording and montage. Students will make short films and be encouraged to explore diverse forms of cinema from fiction to non-fiction to other hybrid forms. The course will include creative workshops, film screenings and discussions of student work.

Course Note: The instructor of this course is Tala Hadid.

This is an introductory-level course limited to 10 students. If there are more than 10 applicants, preference will be given to concentrators and intended concentrators in AFVS, for whom there are concentration requirements to fulfill, and then to other undergraduates.

Building the Real: Non-Fiction Essentials (New Course)

MW 0300 PM - 0545 PM

Course ID: 110029
2026 Spring (4 Credits)

Instructor Permission Required

This introductory production course teaches students the basics of non-fiction filmmaking. We cover camera operation, sound recording, interview strategies, and editing. Classes will be a mixture of workshops and discussion of other students' work, with film screenings and readings that build on these technical concepts. This will be an intensive, hands-on course with weekly filmmaking exercises to help build students' skills.

SPRING 2026: Please visit the course website to learn enrollment process prior to sending a petition in my.harvard. The instructor of this course is Theo Anthony.

AFVS 70 (1)

The Art of Film

MW 1030 AM - 1145 AM

Course ID: 115688
2026 Spring (4 Credits)

Instructor Permission Required

This introductory course surveys the history of film and visual media in the 20th and 21st centuries. We will both explore the rise of major cinematic movements in their striving to define the "art of film" and shed light on the often overlooked parts and marginalized figures in the history of film. Building upon Rudolf Arnheim's concept of visual thinking, this class puts special emphasis on creative practices and visual exercises that introduce students to new forms of visual expression and argumentation. Weekly video blogs, a visual essay, and a collaborative film festival project will further advance and diversify our multi-faceted approach to the history of

film and visual media.

Course Note: This course is required for all students concentrating in or pursuing a secondary field in the film and visual studies track of AFVS.

Tutorial - Sophomore Year

2026 Spring (4 Credits)

R 0600 PM - 0800 PM

Instructor Permission Required

Annette Lemieux

A tutorial course on the foundations and subjects of Art, Film and Visual Studies, encompassing Film, Video and Animation; Studio Art and Photography; Film Studies; Environmental Studies; Design; and Curatorial Studies, including the work of both the Harvard Film Archive and the Carpenter Center for the Visual Arts. Supported by readings, screenings, collaborative workshops, field trips, and project-based assignments, the tutorial is taught by a rotation of the regular and visiting faculty. In this year's course, students will focus on developing both the ethics and aesthetics of their practice, individually and collectively considering the problems and opportunities of presenting work and research publicly in an ever-changing cultural climate.

Course Note: Required of all AFVS concentrators during their first full term in the concentration, ordinarily sophomore spring.

There is a mandatory lab for this course on Tuesdays from 12:45-2:45.

This course is required for all AFVS concentrators.

FAS Divisional Distribution: Arts and Humanities

Drawing 2: Subversive Marks: Drawing, Notation, and Meaning

W 0130 PM - 0545 PM

Instructor Permission Required

Katarina Burin

The close look at, and adoption of, drawing as a functional tool. This typology of drawing is often found in scientific journals and extra-artistic contexts in the form of diagrams, symbols, maps, calendars, graphic models, architectural renderings and technical illustrations of many kinds. These drawings often imply or suggest a lack of poetic and artistic goals, inviting unambiguous readings of specific content. We will explore, manipulate, subvert, or find alternative uses for these often overlooked drawing conventions. A new drawing vocabulary will emerge from our research and practice. Through the use of these new drawing vocabularies we will develop our own systems of visual communication and conceptual experimentation. The result will be the creation of experimental bodies of knowledge and new forms of thought - essentially developing an archive based on individual interests and goals. These archives can be subversive, interrogative, playful or serious. Along with projects and assignments we will delve into a long tradition of artists who have undermined established systems of knowledge, taste, and hierarchy by rethinking and sometimes fictionalizing their archives.

AFVS 114 (1)

Course ID: 219697
2026 Spring (4 Credits)

Hoarding Fever/Archive Fatigue (Studio Course)

Katarina Burin

Why do we decide to keep things? What politics hide in taxonomy? How do citizenship, colonialism, and death relate to our stuff? And what's the deal with Marie Kondo? This studio course will use the discourses around Archive and research based practice as a starting point for developing work in a range of media. We will look at existing archives, develop our own collections as a form of artistic practice, and destabilize the authority of archives by considering informal, queer, pathologized forms of collecting. The course will include discussions and readings; visits to local collections in and outside the museum; and ample studio time to work with raw and found materials, alongside obsessive investigations and meandering digressions.

Course Note: This is an introductory studio course available to all levels of experience open for grad students and undergraduates. Hoarders and non-hoarders are welcome!

Abstraction

2026 Spring (4 Credits)

MW 1200 PM - 0245 PM

Instructor Permission Required

Kianja Strobot

This course emphasizes the role of composition, color and form outside of representation. How does an artist working outside of nameable objects transfer intent? Far from creating a mess - this course seeks to explore through making, the means, reasons and many definitions of abstraction. Starting with the square - students will move from visual problem solving on two dimensional surfaces into their own projects. While the initial emphasis will focus on abstraction in painting, students are encouraged to branch out into other dimensions as the semester progresses. Rigorous making will be buttressed by discussion, texts, videos and material questioning.

Course Note: This course is open to all levels, however those with previous painting/ AFVS course experience are encouraged.

Woven Forms: The Textile Studio

2025 Fall (4 Credits)

W 0130 PM - 0530 PM

Instructor Permission Required

Laura Frahm, Katarina Burin

This hybrid studio/visual studies course explores textiles and textile practices from multiple perspectives. We will examine the histories of textile cultures, study the pioneering work of women weavers and artists in the 20th and 21st centuries, and engage directly with weaving techniques and textile design. Combining seminar discussions with hands-on practice, we will explore textile histories, cultures, and methodologies through readings, guest lectures, archival visits, and weekly weaving workshops. Our research will culminate in an exhibition showcasing collection materials alongside student projects developed through semester-long experimentation.

Surreal Self: Intermediate Photography Course

R 0130 PM - 0545 PM

Keisha Scarville

Course ID: 225847
2025 Fall (4 Credits)

Instructor Permission Required

This course is designed for students to embrace the experimental depths of photography. This class will chart the history of surrealism as a cultural movement from the 1920s to its current iteration as a vehicle for resistance and visual pleasure. Through the language of surrealism, students will explore how to incorporate symbolism and metaphors to make latent narratives complexly visible. A series of prompts and collaborative activities will offer students expansive entry points for approaching portraiture and constructing conceptual visual narratives. We will study a range of artists including Man Ray, Florence Henri, Lee Miller, Katie Horna, Claude Cahun, Dora Maar, to Nydia Blas, Lieko Shiga, and Wangechi Mutu. Class time will be structured around slide lectures, readings, group critiques and discussions, field trips to see relevant exhibitions, and individual meetings with the instructor.

Course Note: A prerequisite for the class is an Introduction to Photography Class or permission of the instructor. FALL 2025: To enroll in this class, visit the course web site for instructions BEFORE sending a petition via my.harvard.

AFVS 143F (1)

Sequencing Photographs

W 0130 PM - 0545 PM

Course ID: 226408
2025 Fall (4 Credits)

Instructor Permission Required

In this course we will explore visual language and the photobook. The meaning of a single photograph is ambiguous until it bumps into something else. Visual language is like verbal language, where context determines the message. Understanding this will help give you more control over the possible meanings of your own photographs, and to help you read and critique pictures out in the world. The first half of the term will involve group & individual exercises with found imagery, where we recycle images in multiple contexts, to the point of exhaustion. We will think in abstract and narrative ways. The goal is to expand your ability to understand what a picture can mean. We will also have field trips to look at photobooks, prints and films. In the second half we will shift our focus into production—to make something with pictures. We will explore an archive and let the pictures guide our process.

The instructor of this course is Jason Fulford. FALL 2025: To enroll in this class, visit the course web site for instructions BEFORE sending a petition via my.harvard.

Sleight of Hand Sleight of Mind: Creative Process and Photography

MW 1245 PM - 0245 PM

Sharon Harper

Course ID: 222779
2026 Spring (4 Credits)

Instructor Permission Required

Sleight of Hand Sleight of Mind is an intermediate/advanced studio photography seminar. Your self-directed image-making practice will be balanced by learning to parse creative decisions that are part of image-making. Supported by readings on contemporary photography and creative process, the class is designed to sharpen your understanding of lens-based and image-based creativity. We will analyze unaltered photographs, as well as photographic processes such as cutting, collaging, hammering, painting, soaking, blotting, erasing, lighting, digging, and dismantling. Some of the artists we will study include Paul Mpagi Sepuya, Farah Al Qasimi, Tarrah Krajinak, and Jan McCullough, among others. Class time will be structured around small group discussions, group critiques, field trips to see relevant exhibitions, and individual meetings with the instructor. The development of your work will be supported within regularly scheduled evening lab time with a teaching assistant present. The prerequisite for this class is an introduction to photography class or permission of the instructor.

Course Note: The prerequisite for this class is an introduction to photography class or permission of the instructor.

Where the Wild Things Are: Intermediate Photography Course

Course ID: 205211
2025 Fall (4 Credits)

Richard Renaldi

Students will develop a cohesive, long-term photographic project originating from their own experience. They will be challenged to approach difficult themes, interior emotional content, or imbalances they perceive in the world around them. Subjects may include, but are not limited to, significant events, upheaval, or desire. The course will address the uses of allegory and metaphor in image-making, as well as the mechanics of editing, sequencing, and essay-writing in support of a body of work that conveys an original point of view. Additionally, this class is organized around presentations on artists' work and photographic concepts, assignments around portraiture and self-portraiture, individual meetings with the instructor, readings and reading discussions, group critiques, field trips, and visiting artist presentations.

Course Note: Interested students must attend first meeting of class to speak with teaching staff about enrollment procedures.

FALL 2025: To enroll in this class, visit the course web site for instructions BEFORE sending a petition via my.harvard.

Pre-req: Prior introductory photography course, or the permission of the instructor.

Film Directing: Approaching Fiction Now

2025 Fall (4 Credits)

TR 0300 PM - 0545 PM

Instructor Permission Required

This course guides students through different issues and challenges in the filmmaking process from the initial development of ideas through to completion. Throughout the semester, students will write and discuss their own short film scripts. At the end of the first semester, these projects will be ready to move through the pre-production process so that they can be shot during the second semester. Emphasis is placed on finding a voice, point of view and approaching the film language. There will be formal explorations and various assignments which impose restrictions. Throughout several personal and group exercises different topics will be explored, such as: directing actors, composition, directorial authorship, as well as the role of camera work in conjunction with narrative structure. In-class screenings and critiques of student assignments will form an important component of the course.

The instructor of this course is Mamadou Dia. FALL 2025: To enroll in this class, visit the course web site for instructions BEFORE sending a petition via my.harvard.

AFVS 50 or two other AFVS courses in video or film production required.

Lo-fi Sci-fi (intermediate video production)

TR 1200 PM - 0245 PM

Joana Pimenta

Course ID: 222794
2025 Fall (4 Credits)

Instructor Permission Required

In this intermediate video production course, students will work with narrative, conceptual, aesthetic forms, and filmmaking processes derived from science fiction to produce hybrid nonfiction short films. The class will explore the generative possibilities of the real in the production of fiction works, as well as fictional and genre strategies for working in nonfiction filmmaking. We will work hybridly between fiction and nonfiction, exploring the possibilities that scriptwriting for nonfiction, creating sets and objects, and working with non-professional actors, open to our work as filmmakers. The temporal, spatial, and narrative possibilities offered by the genre of science fiction will be mobilized to explore hybrid forms of filmmaking. Assignments will encompass video and sound recording and editing, cinematography and montage, and each student will produce a final film during the semester. Class time will include technical workshops, film screenings, discussions of student work, as well as occasional visiting filmmakers.

Course Note: Pre-requisites: One AFVS film/video course, or equivalent work produced in film/video with permission from the instructor

Vertical Cinema

TR 1245 PM - 0245 PM

Karthik Pandian

Course ID: 205411
2026 Spring (4 Credits)

Instructor Permission Required

The ever-increasing flexibility of video presentation technology creates the opportunity to reconsider cinema's most deeply rooted conventions. In this production course, students reflect on the cultural connotations of verticality (from portraiture to social media and the aesthetics of witness), to create their own vertical video projects using a range of available cameras. Through screenings, readings, discussions, workshops, and museum visits focused on creators who have investigated and disrupted aspect ratio, distribution, and the presentation of moving images, we will pursue a phenomenology of format through the creation of 9:16 work.

Course Note: As a 100-level intermediate course, Vertical Cinema will not cover the elementary basics of shooting and editing video.

Prior experience with video production including basic familiarity with shooting on DSLRs or more advanced cameras and editing in Premiere.

FAS Divisional Distribution: Arts and Humanities

AFVS 174E (1)

Surroundings: Media and Environment

R 1200 PM - 0245 PM

Course ID: 226788
2026 Spring (4 Credits)

Instructor Permission Required

This seminar investigates the relationship between media and environment, charting their changing and overlapping senses from the 19th century to today. The course both reconsiders the "environmental" in the work of fundamental media theorists and examines how contemporary filmmakers, artists, and writers provocatively blur art and science, the human and the non-human, the cultural and the natural. Questions focus on how climate, economic, and political realities challenge artists to critically trace and intervene in the often-invisible interconnections of energy, material, infrastructure, finance, and computation. Topics include air-conditioning, ambient media, science fiction, and petroculture. Sessions include archival visits, class excursions, film screenings, and listening exercises.

SPRING 2026: Please visit the course website to learn enrollment procedures before sending a petition to my.harvard. The instructor of this course is Dan D'Amore.

AFVS 175 (1)

Introduction to Visual Culture

T 0945 AM - 1145 AM

Course ID: 224462
2025 Fall (4 Credits)

Instructor Permission Required

What is a medium? And how can the history of the term—the ways in which it has been used and defined, both by artists and theorists—help us answer this question? The first part of the course will present the different ways in which the concept of medium has been historically understood: as a set of techniques and material supports for some form of artistic representation (such as painting, photography, and film); as an extension of the human body and its sensory organs into the surrounding environment; as a series of technical means for the recording, storing, processing, and transmitting of signals and information; as an object or a person capable of acting as an intermediary between the living and the dead; finally, as a sensorial environment or atmosphere. The second part will then discuss some of the recent developments in media theory, tackling questions such as cultural techniques, media archaeology, elemental media, media ecologies and media environments. Each of the lectures will refer to key texts in the field of media theories, and to a series of examples from the fields of art, photography, film, and visual culture.

AFVS 188P (1)

Global Photography: Decolonizing the Gaze

M 0945 AM - 1145 AM

Course ID: 226522
2025 Fall (4 Credits)

Instructor Permission Required

Photography has since its first public presentation in 1839 been described as an essentially Western technology and a tool of imperialism. Yet, this apparatus was appropriated across the globe almost simultaneously, from Ethiopia to India, from China to Mexico. This course will offer an introduction to photography's global histories and theories from the nineteenth century to the present, centering the gaze, art and epistemologies of those working outside the West, in what Shahidul Alam prefers to call the "majority world." This seminar will move chronologically and thematically, to explore key moments, such as photography's origin stories and its entanglement with colonial empires, and consider key genres, aesthetics, and interventions artists have made to expand, and decolonize, the art of photography.

The instructor of this course is Giulia Paoletti. FALL 2025: To enroll in this class, visit the course web site for instructions BEFORE sending a petition via my.harvard.

FAS Divisional Distribution: Arts and Humanities

AFVS 215 (1)

Critical Printing

TR 1200 PM - 0245 PM

Matt Saunders, Jennifer L. Roberts

Course ID: 205183

2026 Spring (4 Credits)

Instructor Permission Required

Incorporating both studio and seminar instruction, this intensive course will explore printmaking's history, trace its particular forms of intelligence, and test its future potential. The class will meet for three hours of studio and two hours of seminar/discussion per week. Assignments will include weekly readings, a short scholarly paper, and two studio projects. For the first half of the semester, students will pursue a rigorous grounding in a particular historical technique (etching/intaglio); in the second half students will translate what they have learned to another medium, thus exploring printmaking as an expanded field of practice.

Previous studio art course recommended but not required.

FAS Divisional Distribution: Arts and Humanities

AFVS 222 (1)

AI and Art

M 0300 PM - 0500 PM

Antonio Somaini

Course ID: 224467

2025 Fall (4 Credits)

Instructor Permission Required

This seminar will study the ways in which, beginning with the early 2010s, artists have tackled the various deep learning algorithms and models that are currently profoundly transforming the ways in which images are captured, generated, modified, described, and seen. We will analyze some of these different algorithms and models, studying their architecture, the datasets that are used to train them, and the different operations they may perform. After discussing the ways in which artists have elaborated critical responses to the ethical, epistemological, environmental and political questions raised by technologies of machine vision and face recognition, we will tackle the field of Generative AI, to study how artists have used deep learning algorithms such as the Generative Adversarial Networks (GANs) and the recent text-to-image and text-to-video models. Among the artists whose writings and works will be discussed in the seminar, are Nora Al-Badri, Julian Charrière, Grégory Chatonsky, Kate Crawford & Vladan Joler, Justine Emard, Holly Herndon & Mat Dryhurst, Pierre Huyghe, Egor Kraft, Agnieszka Kurant, Trevor Paglen, Anna Ridler, Hito Steyerl, Taller Estampa, Gwenola Wagon & Pierre Cassou-Noguès.

Course Note: There will be a mandatory two-hour film screening three times during the semester; schedule to be

determined.

AFVS 241 (1)

New Media Theory

R 0300 PM - 0500 PM

Laura Frahm

Course ID: 110046

2026 Spring (4 Credits)

Instructor Permission Required

This graduate course surveys new developments in media theory and provides an overview of advanced approaches to the study of media. We will look at different schools and streams of thought that productively expand and transform the established corpus of media theory. This year, our survey of recent media theoretical positions will also serve as the conceptual ground for our upcoming FVS graduate conference in May 2026. Weekly response papers, film screenings, and research projects will be vital components of our course and further advance our semester-long survey of new voices and positions in media theory.

Course Note: A background in film and media theory will be helpful to fully engage in the course materials.

FAS Divisional Distribution: Arts and Humanities

AFVS 252 (1)

Sonic Ethnography

No meeting time listed

Course ID: 108976

2026 Spring (4 Credits)

Instructor Permission Required

This is a practice-based course in which students record, edit, and produce anthropologically informed audio works. Students will select a local 'site' where they can safely spend time throughout semester, and where the basic activity of research is stereo audio recording. Given our current spatial dispersion, this semester the focus will be on composing specifically for headphones. Over the course of the semester, listening sessions will provide a broad context of contemporary work using location recordings, and readings will situate the practice in relation to adjacent currents. In their projects, students will experiment with technical and conceptual strategies of recording and composition as they engage with questions of ethnographic representation through the medium of audio.

The instructor of this course is Ernst Karel.

Experience in media production helpful but not required.

FAS Divisional Distribution: Arts and Humanities

AFVS 254 (1)

Audio in Multimodal Practice

No meeting time listed

Course ID: 217647

2026 Spring (4 Credits)

Instructor Permission Required

This course presents an opportunity for students engaged in media anthropology, critical media practice, art, or other audiovisual enterprises to focus primarily on the sonic aspects of their engagements, and to gain experience and expertise in working with audio in conjunction with other media.

FAS Divisional Distribution: Arts and Humanities

AFVS 264 (1)

Advanced Projects in Time-Based Media

R 0345 PM - 0545 PM

Karthik Pandian

Course ID: 222777

2025 Fall (4 Credits)

Instructor Permission Required

A workshop for advanced students pursuing self-directed projects in film, video, performance, or other time-based media. Students are expected to produce one substantial project which can take the form of a single-channel film or video, moving image installation, live event, or other time-based work. One-on-one meetings with the instructor, midterm in-progress and final group critiques, and a small production budget support the

development of student work. Screenings, visits by guest artists, workshops, and field trips will also be organized in relation to student interests, which should be articulated when expressing interest in the course via a brief project proposal.

Course Note: Primarily geared towards graduate students but is also suitable for juniors preparing to pursue a thesis and seniors working on their thesis.

FALL 2025: To enroll in this class, visit the course web site for instructions BEFORE sending a petition via my.harvard.

Pre-req: Technical fluency in the time-based medium of your choice

AFVS 272

Proseminar in Film and Visual Studies

W 0300 PM - 0500 PM

David Joselit

Course ID: 220204

2025 Fall (4 Credits)

Instructor Permission Required

This course prepares students to generate research questions in Visual Studies through close analysis of visual artifacts in Harvard collections and rigorous readings of major 20th and 21st century scholarly sources, largely but not exclusively in photo and film history. It defines Visual Studies in terms of relationships between disciplines dedicated to aesthetic analysis such as art history and film studies with fields engaged with the social meaning of images such as anthropology, critical theory and media studies.

Course Note: This course is required of all incoming graduate students in Film and Visual Studies and all graduate students who wish to declare a secondary field in Film and Visual Studies.

FALL 2025: To enroll in this class, visit the course web site for instructions BEFORE sending a petition via my.harvard.

FAS Divisional Distribution: Arts and Humanities

AFVS 288P (1)

Photography and Textile: A History of Intermediality

W 0945 AM - 1145 AM

Course ID: 226523

2025 Fall (4 Credits)

Instructor Permission Required

This graduate seminar explores photography's—historical, material and theoretical—entanglements with textile. While extensive literature exists on the relation between photography and painting, and photography and sculpture, studies on the intermedial relation between photography and textile remain to a great extent isolated case studies. This course will offer the opportunity to track such intimate connections across history and geographies, spanning from Henry Fox Talbot's lace photographs of the 1830s, to the contemporary, with artists such as Monica de Miranda, who embroiders her photographic landscapes and Billie Zangewa, who infuses her silk tapestries with a "photographic aesthetic." With the objective of exploring how these media, their aesthetics, maneuvering and fibers have overlapped, this course will offer new frames and vocabularies to rethink each and both.

The instructor of this course is Giulia Paoletti. FALL 2025: To enroll in this class, visit the course web site for instructions BEFORE sending a petition via my.harvard.

ASTRON 16

Stellar and Planetary Astronomy

MWF 0130 PM - 0245 PM

John Johnson

This course provides an introduction to the physical principles describing the formation and evolution of stars and their planetary companions. Topics include thermal radiation and stellar spectra; telescopes; energy generation in stars; stellar evolution; orbital dynamics; the Solar system; and exoplanets. This course includes an observational component: students will determine the distance to the Sun, and use the Clay Telescope atop the Science Center to study stellar evolution and detect exoplanets.

Course Note: This course is offered each year.

An introductory course in mechanics, which may be taken concurrently, satisfied by Physics 11a, Physics 15a, Physics 16 or Physical Sciences 12a.

Requires: Prerequisite: Physics 15a, Physics 16, or Physical Sciences 12a. May be taken concurrently.

FAS Divisional Distribution: Science & Engineering & Applied Science

ASTRON 17

Galactic and Extragalactic Astronomy

MWF 0130 PM - 0245 PM

Christopher Stubbs

This course will introduce you to the physical principles describing galaxies and the composition and evolution of the Universe. We will cover a wide range of topics from nearby galaxies to quasars to the Big Bang. The goals of the course are 1) to introduce you to the broad sweep of extragalactic astronomy and cosmology, including major concepts and common jargon, 2) to develop detailed applications of physics, particularly mechanics, to galaxies and cosmology, 3) to gain exploratory experience in observational astronomy.

Course Note: This course is offered each year.

An introductory course in mechanics, which may be taken concurrently, satisfied by Physics 11a, Physics 15a, Physics 16, or Physical Sciences 12a, as well as a course in integral calculus, which may be taken concurrently, satisfied by Math 1b.

Introduction to General Relativity

2025 Fall (4 Credits)

MW 0300 PM - 0415 PM

Xingang Chen

Recent exploration of black holes, gravitational waves, and cosmology have revealed the relativistic Universe like never before. This course will introduce students to the theory of general relativity and some of its key applications. Topics include: review of special relativity, physics in curved spacetimes, the Einstein field equations, gravitational lensing, black holes, gravitational waves, and cosmology. Mathematics used in general relativity will be introduced along the way.

Course Note: Course offered annually in the Fall

Multivariable calculus (e.g. Math 21A), linear algebra and differential equations (e.g. Math 21B), college-level Mechanics including special relativity (e.g. Physics 15A), and E&M (e.g. Physics 15B).

FAS Divisional Distribution: Science & Engineering & Applied Science

ASTRON 191

Astrophysics Laboratory

WF 0300 PM - 0415 PM

John Kovac

Laboratory and observational projects in astrophysics. Students design and undertake two projects, under the guidance of Center for Astrophysics scientists and staff, from a selection that includes areas of active research such as: observational studies of the cosmic microwave background radiation, molecules in interstellar clouds, the rotation of the galaxy, galactic molecular sources with the submillimeter array (SMA), and laboratory experiments including submillimeter optics, superconducting detectors, x-ray CCDs, and hard x-ray imaging detectors and telescopes. Students will learn the end-to-end practice of experimental astrophysics, including measurement design and proposal, execution, analysis and appropriate use of statistical techniques, and presentation of results, all done in small teams. They will individually write the results of each project in a format that is appropriate for a peer-reviewed journal.

Course Note: Primarily for concentrators in astrophysics or combined concentrators with physics, in their third or fourth year. A substantial amount of outside reading is expected. Students with physics as their primary concentration, but with a serious interest in astrophysics, may take this to satisfy their laboratory requirement (in lieu of Physics 191) upon petition to the Head Tutor in Physics. Offered each year.

Astronomy 16/17 and Physics 15a/15b/15c, or equivalent courses

ASTRON 202A

Extragalactic Astronomy and Cosmology I

TR 1030 AM - 1145 AM

Charlie Conroy

Course ID: 118139
2025 Fall (4 Credits)

Instructor Permission Required

This course provides an integrated introduction to extragalactic astrophysics and cosmology. Notable topics include: fundamental cosmology, growth of cosmic structure, gravitational dynamics of halos and galaxies, and astrophysics of galaxy evolution.

FAS Divisional Distribution: Science & Engineering & Applied Science

ASTRON 203

Interstellar Medium and Star Formation

No meeting time listed

Karin Öberg

Course ID: 118138
2026 Spring (4 Credits)

The interstellar medium (ISM) is the reservoir of gas and dust between stars. It is the nursery of new stars and planets, and the depository of energy and material from stellar winds and supernovae. This course will treat the often extreme physics and chemistry of the interstellar medium under its observed range of temperatures, densities, and radiation fields. It will cover the processes that govern the interactions between the ISM, stars and their host galaxies, including star and planet formation, and feedback from stellar deaths. The observational and laboratory methods and results that underpin the theories of interstellar environments will be highlighted.

Requires: Graduate Students Only (Undergraduates can submit a request to enroll)

FAS Divisional Distribution: Science & Engineering & Applied Science

ASTRON 205

Machine Learning for Astrophysicists

MW 0130 PM - 0245 PM

Ashley Villar

Topic: Machine Learning

A survey course of statistical and data-driven methodologies widely utilized in astrophysics. Topics will include introductory Bayesian statistics, unsupervised methods (dimensionality reduction, density estimation, clustering), supervised methods (classification, prediction, inference), and deep learning techniques (neural networks, generative methods). This course will focus on both the theory behind these methodologies and their application to astronomical datasets. This course is open to undergraduate and graduate students.

Course ID: 224002
2026 Spring (4 Credits)

Requires: Graduate Students Only (Undergraduates can submit a request to enroll)

FAS Divisional Distribution: Science & Engineering & Applied Science

ASTRON 209

Exoplanet Systems

TR 0130 PM - 0245 PM

John Johnson

Course ID: 108130
2025 Fall (4 Credits)

A survey of the rapidly evolving field of exoplanets with the goal of equipping students with the ability to identify and pursue research questions. Topics include observational methods and instrumentation to detect and characterize exoplanets; properties of stellar hosts; formation and dynamical evolution of planetary systems; composition and physical structure of planets; planetary atmospheres; habitable zones and biosignatures.

Course Note: This course is intended for graduate students and upper division undergraduates concentrating in astrophysics or related fields. Students who do not have a CfA computer account should contact the course head well in advance of the first day of class. Next offered Fall 2021

ASTRON 214**Observational Astronomy**

T 0300 PM - 0545 PM

Daniel Eisenstein

Course ID: 220177

2025 Fall (4 Credits)

Instructor Permission Required

This course will focus on the principles of observational astronomy, with a focus on the physical principles, design considerations, and operational concerns of telescopes and instruments. It is not a course on the analysis of observational data, nor on the design of astronomical observing programs. The course is built from two segments. The first is a one-week class trip to Arizona, typically in June before the Fall term, to visit the MMT and other local telescopes. This trip is highly intensive, with of order 8 hours of class activities per day. We tour the telescopes and have seminar-style classes and problem sessions at the facility. The focus of the material is on how telescopes and instruments work, using back-of-the-envelope calculations to explore the physical aspects of the key constraints. The second segment will occur during the Fall teaching term and features seminars focusing on telescopes and instrumentation for X-ray, radio, and millimeter astronomy. These seminars will require a modest amount of preparatory reading and post-class quantitative exercises. Students will complete term papers and present them to the class in November, before Thanksgiving break. This course can be taken for credit only by graduate students. Astronomy 200 or equivalent is highly recommended. Only students who have participated in the class trip in May-June 2024 or in a previous year are eligible to enroll for credit in Astronomy 214. Students (graduate or undergraduate) wishing to audit the Fall semester module should contact the course lead.

Pre-req: Attendance on the class trip in May 2025 and permission of the instructor

ASTRON 215**Relativistic Astrophysics: Black Holes, Neutron Stars, and High-Energy Phenomena**

WF 0900 AM - 1015 AM

Michael Johnson

Course ID: 226430

2025 Fall (4 Credits)

Instructor Permission Required

This course explores the most extreme environments in the universe, where the interplay between gravity, matter, and radiation drive a rich variety of observed astrophysical phenomena including active galactic nuclei, pulsars, gamma-ray bursts, and fast radio bursts. This course will introduce the essential elements of astrophysics in curved spacetime, including the formation of compact objects, gravitational radiation, and emission mechanisms in relativistic plasmas. It will include a survey of observational methods, analytical techniques, and computational approaches in modern relativistic astrophysics.

This course explores the most extreme environments in the universe, where the interplay between gravity, matter, and radiation drive a rich variety of observed astrophysical phenomena including active galactic nuclei, pulsars, gamma-ray bursts, and fast radio bursts. This course will introduce the essential elements of astrophysics in curved spacetime, including the formation of compact objects, gravitational radiation, and emission mechanisms in relativistic plasmas. It will include a survey of observational methods, analytical techniques, and computational approaches in modern relativistic astrophysics. Prerequisites: Undergraduate electromagnetism (e.g., Physics 153), quantum mechanics (Physics 143a). Prior exposure to general relativity (e.g., Astron 140) is useful but not required. Radiative processes (Astron 200) is a recommended co-requisite.

Instructor Permission Required

This semester we will lay out a plausible story of how life emerged on Earth from chemistry that led to the synthesis of molecular building blocks, which in turn self-assembled to form cells. I will do that by reviewing two recent papers – the required reading for this course [1,2]. Each week we will also use, as necessary, relevant papers to the topics to be discussed. The list of topics is enclosed in the syllabus, as are some of the papers.

Lisa Kewley

Course ID: 224326
2025 Fall (4 Credits)

Instructor Permission Required

This writing intensive will provide astronomy students with the skills, tools, and techniques to prepare clear and concise scientific publications. This course is for graduate students who will have completed observational or

theoretical data analysis and figure preparation, and who will be ready for publication writing at the time of the intensive week. Students will be required to work on a paper outline with their project supervisor prior to the intensive week. Class participants will meet in early July for a preparatory session to ensure readiness for the intensive week. The intensive week consists of 40 contact hours. The intensive week includes lectures, goal setting sessions, writing focus sessions, peer review sessions, and writing problem-solving sessions. Most students are able to write a half to a full publication draft during the writing intensive week (depending on the length of the publication). The publication will then be completed during the semester, with regular check-ins to be scheduled. By the end of the Fall, students will have completed a draft publication. Participants will meet in November for a wrap-up session.

Writing intensive week to be held Aug 25-29, 2025, at the Harvard Observatory (60 Garden Street). Science papers to be reviewed over the course of fall 2025 term.

Human Physiology	2025 Fall (4 Credits)

Nancy Long Sieber

As an introduction to the principles governing function in the human body, this course is designed to provide a framework in physiology for future public health researchers and professionals who have not taken college level physiology courses. Emphasis is placed on the concept of homeostasis and on integrative aspects of physiology. Examples of pathophysiology and environmental physiology will highlight these processes. Course Activities: Problem sets, exams, laboratory Course note: students should have taken college level introductory biology before taking this class

Course Note: Offered jointly with the School of Public Health as EH 205

THIS CLASS HAS PRIORITY ENROLLMENT Priority Wave Groups Wave 1 | EH Plans and Subplans Wave 2 | PHD BPH, PHS SBS, PHS EPI & Wave 1 Wave 3 | Open

Enrollment ----- Priority Wave Timing Wave 1 | 8/14/2025 11:00 AM - 8/24/2025 11:59 PM Wave 2 | 8/25/2025 12:00 AM - 8/27/2025 11:59 PM Wave 3 | 8/28/2025 12:00 AM

Enrollment Deadline (varies by session) Any student who does not meet the Wave 1 or Wave 2 criteria can add themselves to the waitlist (if enrollment requirements are met) at any time during the enrollment period. At the beginning of each priority wave, students on the waitlist who meet the Wave's criteria will be automatically enrolled into any remaining seats in the course (pending no time conflicts) **Cross-Registrants and Non-Degree Students will be enrolled on a space available basis after the enrollment deadline for the course

Pathophysiology of Human Disease

2026 Spring (4 Credits)

MW 0200 PM - 0330 PM

Instructor Permission Required

Nancy Long Sieber, Kristopher Sarosiek

This course explores the pathogenesis of disease by examining mechanisms operating at the molecular, cellular, system and whole-body levels. We will discuss diseases of the major body systems, as well as hematological disorders, cancer, the normal and abnormal function of the immune system, as well as aging and death. Throughout the course we will look for common underlying pathogenic pathways and integrate relevant public health perspectives on the epidemiology or control of diseases.

Prior coursework in normal physiology is recommended but not mandatory

BPH 215

Course ID: 115767

Principles of Toxicology

2025 Fall (4 Credits)

MW 0945 AM - 1115 AM

Instructor Permission Required

Jin-Ah Park

The course is designed to expose students to the principles and methods that should be used to determine whether a causal relationship exists between specific doses of an agent and an alleged adverse effect, observed primarily in humans. Integration of principles and methods of toxicology is extremely important since the primary purpose of toxicology is to predict human toxicity. Toxicological data obtained in animal studies must be placed in proper relationship to the exposure observed in the human population. The course deals with organ systems and whole organisms but relies on an understanding of the mechanistic approaches covered in EH508. Key target organs, selected classes of toxic agents and the application of toxicological principles are covered. Students are assigned a topic for a short presentation.

Course Note: Offered jointly with the School of Public Health as EH 504.

Organic chemistry and mammalian physiology or equivalent.

Biomedical Engineering

Biomedical Engineering

BE 110

Physiological Systems Analysis

MW 1115 AM - 1230 PM

Maurice Smith

Course ID: 150189
2026 Spring (4 Credits)

A survey of systems theory with applications from bioengineering and physiology. Analysis: differential equations, linear and nonlinear systems, stability, the complementary nature of time and frequency domain methods, feedback, and biological oscillations. Applications: nerve function, muscle dynamics, cardiovascular regulation. Laboratory: neural models, feedback control systems, properties of muscle, cardiovascular function.

Engineering Sciences 53 (or equivalent); Physical Sciences 12b (or equivalent); and Math 21a and Math21b (or equivalents)

BE 121

Cellular Engineering

TR 1115 AM - 1230 PM

Kit Parker

Course ID: 119067

2025 Fall (4 Credits)

Instructor Permission Required

This is a combined introductory graduate/upper-level undergraduate course that focuses on examining modern techniques for manipulating cellular behavior and the application of these techniques to problems in the biomedical and biotechnological arenas. Applications in drug discovery, regenerative medicine, and cellular agriculture will be discussed. Topics will include controlling behavior of cells through cell-matrix interactions, cytoskeletal architecture, and cell behavior in processes such as angiogenesis and wound healing. Lectures will review fundamental concepts in cell biology before delving into topical examples from current literature. Students will work weekly in the lab learning cell culture techniques, soft lithography, microscopy, and classical in vitro assays measuring cell behavior.

Course Note: BE121 and ES222 are the same course. This course has a mandatory laboratory section that will require hands-on work outside of scheduled lecture times.

Requires: Prerequisite: LS1a (or LPS A); LS 1b; Math 21b (or equivalent); Physical Sciences 12a and 12b (or equivalents); and Engineering Sciences 53; AND Co-requisite: Biomedical Engineering 110

FAS Divisional Distribution: Science & Engineering & Applied Science

BE 124

Biomechanics of Movement and Assistive Robotics

TR 0945 AM - 1100 AM

Patrick Slade

Course ID: 222521

2026 Spring (4 Credits)

This course will study the fundamentals of human movement, emphasizing applications in rehabilitation, athletics, and assistive devices. Topics will focus on the biomechanical principles of movement (muscle and tendon properties), experimental data collection techniques (motion capture, wearable sensing, and imaging), simulation with musculoskeletal modeling, and cutting-edge topics in assistive robotics (human-centered design, human-in-the-loop optimization, exoskeletons, etc.). A semester-long project will allow students to apply the topics to solve a problem of interest relating to human movement or assisted mobility.

Linear algebra (Math 21b or equivalent), introductory programming ability, and familiarity with physics topics like moments/torques and free body diagrams. We will provide review materials on these preparatory topics to help with assessing your knowledge and getting all students to the same starting point to succeed in the course.

FAS Divisional Distribution: Science & Engineering & Applied Science

BE 125

Tissue Engineering

MW 0345 PM - 0500 PM

David Mooney

Course ID: 121282

2026 Spring (4 Credits)

Fundamental engineering and biological principles underlying field of tissue engineering, along with examples and strategies to engineer specific tissues for clinical use. Students will prepare a paper in the field of tissue engineering, and participate in a weekly laboratory in which they will learn and use methods to fabricate materials and perform 3-D cell culture.

LS1a, Chem17 or 20, or biochemistry and cell biology background.

FAS Divisional Distribution: Science & Engineering & Applied Science

BE 128

Introduction to Biomedical Imaging and Systems

TR 1115 AM - 1230 PM

Linsey Moyer

Course ID: 204470

2026 Spring (4 Credits)

Instructor Permission Required

The course is designed as an introduction for students who want to gain both hands on training as well as an introduction to the physics and image reconstruction techniques involved in generating medical and scientific

images. The course will introduce the fundamentals of the major imaging modalities including, but not limited to: electron microscopy, optical microscopy, x-ray, computed tomography, ultrasound, MRI, and nuclear imaging, as well as an overview of in vivo imaging and molecular imaging.

Physics, calculus; basic biology helpful but not required.

Requires: Prerequisite: Applied Physics 50b OR Physical Sciences 12b OR Physics 15b OR PHYSCI 3 AND Math1b or higher

FAS Divisional Distribution: Science & Engineering & Applied Science

BE 129

Introduction to Bioelectronics

TR 1245 PM - 0200 PM

Jia Liu

Course ID: 211359

2026 Spring (4 Credits)

Instructor Permission Required

This course introduces bioelectronics and its applications in neuroscience, neuroengineering, cardiology, wearable technology, and so on. The focus is on the basic principles of bioelectricity, biochemistry, and physiological behaviors of biological systems and how to design electronic tools to precisely measure and control them. Key themes throughout the course will include bioelectricity, biochemistry, cellular and tissue physiological behavior, optogenetics, sensors, stimulators, circuits, signal processing, electronics-biology interface, and applications. This includes both the practical and theoretical aspects of the topic. Three experimental demonstrations will be included as part of the normal class meeting time. Given its broad coverage, students who enroll in this course are expected to have a substantial background in chemistry, biology, and electrical engineering (see recommended prep and course requirements).

Course Note: This course is intended for juniors and seniors. The total enrollment limit for BE 129 and ES 258 is 20 students.

ENG-SCI 50, ENG-SCI 52, or ENG-SCI 152.

FAS Divisional Distribution: Science & Engineering & Applied Science

BE 131

Neuroengineering

TR 1245 PM - 0200 PM

Jia Liu

Course ID: 216486

2025 Fall (4 Credits)

Instructor Permission Required

This course provides an introduction to biological neural systems, and current engineering efforts to understand, control, and enhance the function of neural systems. The focus is on the basic knowledge of molecular basis, anatomic structures, and electrical functions of central and peripheral nervous systems, and the most state-of-the-art genetic/genomic, optical, electrical, magnetic, and computational tools for nervous systems. Key themes throughout the course will include structures of central and peripheral nervous systems, genetic engineering, RNA sequencing, optogenetics, microscope, bioelectronics, MRI, and computational neuroscience. This includes both the practical and theoretical aspects of the topic.

This course is intended for juniors and seniors with some background in biology or engineering. ENG-SCI 54 and one life science course are recommended.

FAS Divisional Distribution: Science & Engineering & Applied Science

Biophysics

Biophysics

BIOPHYS 170 (0001)

Evolutionary and Quantitative Genomics

MWF 1100 AM - 1215 PM

Leonid Mirny, Tami Lieberman

Course ID: 121318

2025 Fall (4 Credits)

Instructor Permission Required

Aims to develop deep quantitative understanding of basic forces of evolution, molecular evolution, genetic variations and their dynamics in populations, genetics of complex phenotypes, and genome-wide association studies. Application of these foundational concepts to cutting edge studies in epigenetics, gene regulation and chromatin; cancer genomics, and microbiomes. Modules consist of lectures, journal club discussions of high

impact publications, and guest lectures that provide clinical correlates. Homework assignments and final projects aim to develop hands-on experience and understanding of genomic data from evolutionary principles.

Offered jointly with the HST Program/ Harvard Medical School as HT.508. You would register for this course through the normal Harvard Course Enrollment process in [my.harvard.edu](http://web.mit.edu/hst.508/). <http://web.mit.edu/hst.508/>

FAS Divisional Distribution: Science & Engineering & Applied Science

BIOPHYS 205

Computational and Functional Genomics

MWF 0230 PM - 0345 PM

Shamil Sunyaev

Course ID: 119807
2026 Spring (4 Credits)

Instructor Permission Required

This is an upper-level critical paper reading and discussion course in the areas of experimental and computational functional genomics. Topics include genome sequencing, sequence analysis, transcriptomics, epigenomics, gene regulation, proteomics, chemical genomics, metabolomics, phenomics, and genetic variation analysis. Journal articles will comprise both classic, landmark papers in genomics and also more recent papers. Topics will be covered through paper presentations and in-class discussions. Students will be responsible for 'chalk talk' style presentations of assigned articles and leading class discussions of those articles, as well as active participation in discussion of all assigned papers. There will be written and oral presentations of final student proposals at the end of the term.

Molecular Biology (MCB 60 or equivalent), solid understanding of basic probability and statistics.

FAS Divisional Distribution: Science & Engineering & Applied Science

BIOPHYS 242R

Special Topics in Biophysics

TR 0300 PM - 0415 PM

Martha Bulyk, Rachelle Gaudet, Sahand Hormoz

Course ID: 117635
2026 Spring (4 Credits)

Biophysical topics emerging from special interest research not normally available in established curriculum. The 2024-25 year's course (Spring 2025) is focused across 4 topic blocks: Making Sense of High-Dimensional Data; Structure (or the Lack Thereof) and Its Relationship to Function- Seen Through an Atomic Lens; Single-Molecule Biophysics and Measurement Technologies; and Dynamical Systems in Biophysics.

Course Note: Lectures, Problem Set, Research Papers, proposal writing, and potential lab components.

FAS Divisional Distribution: Science & Engineering & Applied Science

BIOPHYS 300

Introduction to Laboratory Research

MWF 0430 PM - 0545 PM

Martha Bulyk, Rachelle Gaudet

Course ID: 121518
2025 Fall (4 Credits)

Instructor Permission Required

Introductory lectures by associated Biophysics faculty members. Lectures Fall semester only accompanied by three periods of instruction in laboratories of structural biology, cell and membrane biophysics, molecular genetics and development, neurobiology, bioinformatics, and physical biochemistry.

Course Note: Fall semester only: meets on both the Cambridge and HMS campuses. Contact department Admin for fall course location and individual faculty member presentation schedule.

Course for G1 Students meets 3 times per week and alternates campuses depending on faculty instructor. Exact schedule will be available from Program Administrator in August. This course also covers student laboratory rotation time.

2026 Spring (4 Credits)
Instructor Permission Required

BIOPHYS 397
Research in Integrin Signaling, Cytoskeleton, and Control of Angiogenesis
No meeting time listed
Don Ingber

Course ID: 120730
2026 Spring (4 Credits)
Instructor Permission Required

BIOPHYS 399
Biomolecular Nanotechnology
No meeting time listed
William Shih

Course ID: 122042
2025 Fall (4 Credits)
Instructor Permission Required

FAS Divisional Distribution: None

BIOPHYS 399
Biomolecular Nanotechnology
No meeting time listed
William Shih

Course ID: 122042
2026 Spring (4 Credits)
Instructor Permission Required

FAS Divisional Distribution: None

BIOPHYS 3000 (1)
Graduate Research Course

Course ID: 003000
2025 Fall (4 Credits)

For students carrying out dissertation research in Biophysics.

FAS Divisional Distribution: None

BIOPHYS 3000 (1)
Graduate Research Course

Course ID: 003000
2026 Spring (4 Credits)

For students carrying out dissertation research in Biophysics.

FAS Divisional Distribution: None

BIOPHYS 3001QC
Research Design and Proposal Writing Quarter Course
T 0900 AM - 1000 AM
Michael Eck, Vassilios Bezzerides

Course ID: 000230
2025 Fall (2 Credits)
Instructor Permission Required

A course to help guide students in developing and writing both experimental and theory research-based proposals.

FAS Divisional Distribution: None

Biostatistics

Biostatistics

BIOSTAT 230
Probability I
TR 0945 AM - 1115 AM
Jeffrey Miller

Course ID: 119844
2025 Fall (4 Credits)
Instructor Permission Required

Axiomatic foundations of probability, independence, conditional probability, joint distributions, transformations, moment generating functions, characteristic functions, moment inequalities, sampling distributions, modes of convergence and their interrelationships, laws of large numbers, central limit theorem, and stochastic processes.

Course Note: Offered jointly with the School of Public Health as BST230.

FAS Divisional Distribution: Science & Engineering & Applied Science

BIOSTAT 231

Statistical Inference I

MW 0945 AM - 1115 AM

Rui Duan

Course ID: 119845

2026 Spring (4 Credits)

Instructor Permission Required

Exponential families, sufficiency, ancillarity, completeness, method of moments, maximum likelihood, unbiased estimation, Rao-Blackwell and Lehmann-Scheffe theorems, information inequality, Neyman-Pearson theory, likelihood ratio, score and Wald tests, uniformly and locally most powerful tests, asymptotic relative efficiency.

Course Note: Offered jointly with the School of Public Health as BST231.

Requires: Prerequisite: Biostatistics 230

FAS Divisional Distribution: Science & Engineering & Applied Science

BIOSTAT 232

Methods I

MW 0800 AM - 0930 AM

Rachel Nethery

Course ID: 119846

2025 Fall (4 Credits)

Instructor Permission Required

Introductory course in the analysis of Gaussian and categorical data. The general linear regression model, ANOVA, robust alternatives based on permutations, model building, resampling methods (bootstrap and jackknife), contingency tables, exact methods, logistic regression.

Course Note: Offered jointly with the School of Public Health as BST232.

Requires: Prerequisite: Biostatistics PhD Program

FAS Divisional Distribution: Science & Engineering & Applied Science

BIOSTAT 233

Methods II

MW 1130 AM - 0100 PM

Sebastien Haneuse

Course ID: 119847

2026 Spring (4 Credits)

Instructor Permission Required

BIOSTAT 233 is an intermediate-level graduate course in the analysis of continuous, categorical, and time-to-event response data, with a focus on regression modeling as a tool for data analysis. While most of the presentation will be from the frequentist perspective, estimation and inference from the Bayesian perspective will be also be presented for select topics. Specific topics include: Heteroskedastic continuous response data; Theory of generalized linear models; Analysis of binary response data; Analysis of count response data; Analysis of multinomial response data; Analysis of time-to-event response data; Basis methods.

Course Note: Offered jointly with the School of Public Health as BST233.

Requires: Prerequisite: Biostatistics 232

FAS Divisional Distribution: Science & Engineering & Applied Science

BIOSTAT 234

Introduction to Data Structures and Algorithms

M 0800 AM - 0930 AM

Junwei Lu

Course ID: 160641

2026 Spring (4 Credits)

Instructor Permission Required

Introduction to the data structures and computer algorithms that are relevant to statistical computing. The implementation of data structures and algorithms for data management and numerical computations are discussed.

FAS Divisional Distribution: Science & Engineering & Applied Science

BIOSTAT 235**Advanced Regression and Statistical Learning**

TR 0945 AM - 1115 AM

Rong Ma

An advanced course in linear models, including both classical theory and methods for high dimensional data. Topics include theory of estimation and hypothesis testing, multiple testing problems and false discovery rates, cross validation and model selection, regularization and the LASSO, principal components and dimension reduction, and classification methods. Background in matrix algebra and linear regression required.

Course Note: Offered jointly with the School of Public Health as BST235.

Requires: Prerequisite: Biostatistics 231 AND Biostatistics 232

FAS Divisional Distribution: Science & Engineering & Applied Science

Course ID: 119848

2026 Spring (4 Credits)

BIOSTAT 236**Computing I**

TR 0800 AM - 0930 AM

Junwei Lu

This is an introductory graduate-level course focusing on statistical computing. It seamlessly blends critical programming and statistical computing concepts, designed to complement the collaborative and reproducible biostatistics research. The curriculum covers a wide array of topics, including (1) optimization techniques such as Gradient Descent (GD), Stochastic Gradient Descent (SGD), Newton's Method, Alternating Direction Method of Multipliers (ADMM), and constrained optimization; (2) sampling methods like Importance Sampling, MarkovChain Monte Carlo (MCMC), Langevin Dynamics, and stable diffusion alongside foundational linear algebra applications through QR and Cholesky Decomposition, and (3) dynamic programming. Beyond the algorithm aspects, the course emphasizes practical skill development, from coding proficiency and essential best practices to the use of computational tools such as Cluster and Linux environments, Git for version control, and techniques for reproducible research using RMarkdown and Jupyter Notebooks. It also covers software development practices with a focus on developing R packages, visualization and web design to effectively communicate findings, and exploring innovative coding approaches, including automation through advanced tools like ChatGPT. This comprehensive course is designed to equip students with the necessary tools and knowledge for navigating the complexities of statistical computing, with a strong emphasis on practical skills like reproducible research, effective coding practices, and the utilization of modern computational tools.

Course Note: Offered jointly with the School of Public Health as BST236.

Course ID: 225026

2026 Spring (4 Credits)

Instructor Permission Required

BIOSTAT 238**Principles and Advanced Topics in Clinical Trials**

MW 0200 PM - 0330 PM

David Wypij

This course focuses on selected advanced topics in design, analysis, and interpretation of clinical trials, including study design; choice of endpoints (including surrogate endpoints); interim analyses and group sequential methods; subgroup analyses; and meta-analyses.

Course Note: Offered jointly with the School of Public Health as BST 214 & BST 238.

Requires: Prerequisite: BIST 230 AND BIST 231 (may be taken concurrently)

FAS Divisional Distribution: Science & Engineering & Applied Science

Course ID: 125262

2026 Spring (4 Credits)

Instructor Permission Required

BIOSTAT 240**Probability II**

TR 0945 AM - 1115 AM

Rajarshi Mukherjee

A foundational course in measure theoretic probability. Topics include measure theory, Lebesgue integration, product measure and Fubini's Theorem, Radon-Nikodym derivatives, conditional probability, conditional expectation, limit theorems on sequences of random variables, stochastic processes, and weak convergence.

Course Note: Offered jointly with the School of Public Health as BST240.

Course ID: 119854

2025 Fall (4 Credits)

Instructor Permission Required

Requires: Prerequisite: Biostatistics 231
FAS Divisional Distribution: Science & Engineering & Applied Science

BIOSTAT 241

Statistical Inference II

TR 0200 PM - 0330 PM

Rui Wang

Course ID: 119855
2026 Spring (4 Credits)

Instructor Permission Required

Advanced topics in statistical inference. Limit theorems, multivariate delta method, properties of maximum likelihood estimators, saddle point approximations, asymptotic relative efficiency, robust and rank-based procedures, resampling methods, nonparametric curve estimation.

Course Note: Offered jointly with the School of Public Health as BST 241.

Requires: Prerequisite: Biostatistics 240
FAS Divisional Distribution: Science & Engineering & Applied Science

BIOSTAT 244

Analysis of Failure Time Data

MW 0945 AM - 1115 AM

L. Wei

Course ID: 119849
2026 Spring (4 Credits)

Instructor Permission Required

Discusses the theoretical basis of concepts and methodologies associated with survival data and censoring, nonparametric tests, and competing risk models. Much of the theory is developed using counting processes and martingale methods.

Course Note: Offered jointly with the School of Public Health as BST 244.

Requires: Prerequisite: BIOSTAT 231 AND BIOSTAT 232
FAS Divisional Distribution: Science & Engineering & Applied Science

BIOSTAT 245

Analysis of Multivariate and Longitudinal Data

TR 1130 AM - 0100 PM

Tom Chen

Course ID: 119850
2025 Fall (4 Credits)

Instructor Permission Required

The multivariate normal distribution, Hotelling's T^2 , MANOVA, repeated measures, the multivariate linear model, random effects and growth curve models, generalized estimating equations, multivariate categorical outcomes, missing data, computational issues for traditional and new methodologies.

Course Note: Offered jointly with the School of Public Health as BST 245.

Requires: Prerequisite: Biostatistics 231
FAS Divisional Distribution: Science & Engineering & Applied Science

BIOSTAT 249 (01)

Bayesian Methodology in Biostatistics

TR 0200 PM - 0330 PM

Lorenzo Trippa

Course ID: 119853
2025 Fall (4 Credits)

Instructor Permission Required

General principles of the Bayesian approach, prior distributions, hierarchical models and modeling techniques, approximate inference, Markov chain Monte Carlo methods, model assessment and comparison. Bayesian approaches to GLMMs, multiple testing, nonparametrics, clinical trials, survival analysis.

Course Note: Offered jointly with the School of Public Health as BST249.

Requires: Prerequisite: Biostatistics 231 AND Biostatistics 232
FAS Divisional Distribution: Science & Engineering & Applied Science

BIOSTAT 258

Causal Inference: Theory and Practice

TR 0200 PM - 0330 PM

Course ID: 223906
2026 Spring (4 Credits)

Instructor Permission Required

Nima Hejazi

Randomized experimentation is the standard for quantifying the causal effect of an intervention in the public health and biomedical sciences, yet randomization may be impossible, impractical, or unethical, leading to real-world scenarios in which causal inferences are based upon observational comparisons. This course reviews the foundations of causal inference in (bio)statistics, outlining causal-analytic methods that help to extract as much evidence as imperfect observational studies carry about causal effects commonly of interest in applied health science settings. This survey of statistical causal inference begins with foundational concepts: the potential outcomes framework and counterfactual random variables, graphical modeling frameworks, and common assumptions and strategies for the identification of the causal effects of static and dynamic interventions. Methodological extensions for studying the causal effects of time-varying, longitudinal interventions will be touched upon as well. Further topics to be addressed may include instrumental variables approaches, principal stratification, causal mediation analysis, treatment effect heterogeneity, the causal dose-response curve, and causal survival analysis. This course may also introduce elements of semi-parametric theory necessary for the development of asymptotically efficient estimators of causal effect estimands. Where possible, the role of modern regression (i.e., machine learning) techniques and tools for the practical estimation of causal effect estimands will be emphasized.

Course Note: Pre-requisites: BIOSTAT 231 and BIOSTAT 232.

FAS Divisional Distribution: Science & Engineering & Applied Science

BIOSTAT 281

Genomic Data Manipulation

MW 0345 PM - 0515 PM

Eric Franzosa, Kelsey Thompson

Course ID: 126944
2026 Spring (4 Credits)

Instructor Permission Required

Introduction to genomic data, computational methods for interpreting these data, and survey of current functional genomics research. Covers biological data processing, programming for large datasets, high-throughput data (sequencing, proteomics, expression, etc.), and related publications.

Course Note: Offered jointly with the School of Public Health as BST 281.

Requires: Prerequisite: BST 272 or BST 273

FAS Divisional Distribution: Science & Engineering & Applied Science

The Origins of Arthur

2025 Fall (4 Credits)

TR 1030 AM - 1145 AM

We explore the British Celtic origins of the better-known medieval Arthur of English and French romance. We will be reading, in translation from Latin and Middle Welsh, the earliest surviving texts featuring the figure of Arthur as well as the retinue of the legendary figures, such as Guinevere and Merlin, who are popularly associated with him. We try and get behind the familiar cast of characters, as arguably first found in Geoffrey of Monmouth's History of the Kings of Britain, and trace how the more familiar later narratives developed. We also study the murky historical context lying behind the evolution of Arthur from Roman Britain to the era of the Norman Conquest and its aftermath.

Course Note: Taught by Prof. Paul Russell (Celtic Languages and Literatures Dept)

Celtic Mythology

2025 Fall (4 Credits)

MW 1200 PM - 0115 PM

Joseph Nagy

Medieval Irish and Welsh texts reflect underlying story patterns, characters, and motifs that are rooted in pre-Christian tradition and in some cases witnessed in the archaeological evidence and in the ethnographic writings of ancient Greek and Roman authors. We will examine these texts in translation and track the reconstruction of the "pagan past" undertaken by medieval Celtic writers, as well as the new mythologies they developed to suit the evolving ideological agenda of their world, from ca 600 to 1500 CE.

Scotland the Brave: Gaelic Song and Society

2025 Fall (4 Credits)

MW 1030 AM - 1145 AM

Natasha Sumner

Scotland the Brave: Gaelic Song and Society An exploration of Scottish Gaelic culture in a time of conflict and drastic change, this course examines authors' preoccupations and creative impulses in the songs of the sixteenth to nineteenth centuries. Among the most renowned compositions in the Gaelic language, these songs respond poignantly to the transformation of Gaelic society from the 'clan' period to the Jacobite Risings, the Highland Clearances, and the Land Wars. Critical issues we will consider include, but are not limited to, the role of the poet in society, tradition and innovation, orality, and intertextuality. No prior experience studying literature and no knowledge of Scottish Gaelic is necessary to succeed in this course. All texts will be read in English translation.

FAS Divisional Distribution: Arts and Humanities

CELTIC 222

The Manuscript Cultures of the Celtic-Speaking World

W 0130 PM - 0330 PM

Course ID: 127634
2026 Spring (4 Credits)

We shall explore the development of the different scripts used to write both in Latin and in the vernacular Celtic languages from the earliest surviving manuscripts through to ca 1700; the different format and layouts of the manuscript page in different contexts; and consider the broader narrative of the continuity but also the loss of manuscript culture in the face of the world of print.

Knowledge of at least one Celtic language and/or Latin is required. Students are encouraged to take Medieval Studies 202 Latin Paleography and Manuscript Culture

CELTIC 340

Celtic Languages and Literatures Proseminar

M 0430 PM - 0630 PM

Natasha Sumner

Course ID: 217824
2026 Spring (4 Credits)

An introduction to Celtic studies and a review of the major critical approaches to the field.

Course Note: Required of candidates for the PhD in Celtic Languages and Literatures. Not open to undergraduates. Enrollment in this course is restricted to G1 and G2 members of the Department of Celtic Languages and Literatures.

FAS Divisional Distribution: None

CELTIC 350A

Teaching Colloquium

T 0500 PM - 0700 PM

Joseph Nagy, Natasha Sumner

Course ID: 207928
2025 Fall (2 Credits)

An introduction to the craft of teaching in Celtic languages and literatures and related subject areas. Required of G2 students in Celtic; open to all graduate students in the department.

Course Note: Meets bi-weekly. Celtic 350A prerequisite for Celtic 350B.

FAS Divisional Distribution: None

Irish

IRISH 132

Course ID: 119128
2025 Fall (4 Credits)

Introduction to Modern Irish

MWRF 0900 AM - 1015 AM

Natasha Sumner, Dylan Cooper

Irish is the first official language of Ireland, and it has been officially recognized in Northern Ireland since 1998. Today Irish is spoken not only in the western 'Gaeltachtaí' (Irish-speaking regions), but also in cities like Dublin and Belfast. There is Irish-language television, film, radio, and print journalism, and many wonderful poets and fiction writers continue into the present a literary tradition that dates back to the sixth century. The course introduces students to Irish as it is spoken and written today. Class work is participatory, and includes conversational role play and games as well as grammar study and drills. Audio and audiovisual resources reinforce pronunciation and aural comprehension. Songs, proverbs, and poems are an integral part of the course, introducing students to the vibrant oral and literary tradition of Gaelic Ireland. Meets 4 times a week.

Course Note: The combination of Irish 132 and 133r satisfies the language requirement. It is recommended in any case that this course be followed by Irish 133r. May not be taken Pass/Fail. Not open to auditors. Meets four times a week for an hour.

FAS Divisional Distribution: None

FAS: Meets Foreign Lang Req: Irish

IRISH 133R

Course ID: 119063
2026 Spring (4 Credits)

Intermediate Modern Irish

MTWR 0900 AM - 1015 AM

Natasha Sumner

A continuation of Irish 132, developing students' fluency in spoken and written Irish. As our knowledge of the language expands, we venture into storytelling, journal writing and writing and performing short skits. Internet, audio and video resources complement the study of grammar and select prose texts.

Course Note: This course, when taken following Irish 132, satisfies the language requirement. May not be taken Pass/Fail. Not open to auditors.

Irish 132 or permission of instructor.

Requires: Prerequisite: IRISH 132

FAS: Meets Foreign Lang Req: Irish

FAS Divisional Distribution: None

IRISH 160R

Course ID: 120282
2025 Fall (4 Credits)

Advanced Modern Irish

MW 0130 PM - 0245 PM

Natasha Sumner

Geared to the interests and aptitudes of the participants, this course enhances students' confidence in using Irish as a medium of oral and written communication and introduces them to the Gaelic literary tradition.

Irish 133r or permission of instructor.

FAS Divisional Distribution: Arts and Humanities

FAS: Meets Foreign Lang Req: Irish

IRISH 200

Course ID: 123266
2025 Fall (4 Credits)

Introduction to Old Irish

MW 0430 PM - 0545 PM

Instructor Permission Required

Joseph Nagy

An introduction to the language of the eighth and ninth centuries, with elementary readings in prose texts.

Course Note: It is suggested that this course be followed by Irish 201r.

FAS: Meets Foreign Lang Req: Irish

FAS Divisional Distribution: None

IRISH 201R

Continuing Old Irish

MW 0430 PM - 0545 PM

Joseph Nagy

Further grammatical study, with continued reading of saga texts.

Course ID: 117752
2026 Spring (4 Credits)

Irish 200 or permission of the instructor.

FAS: Meets Foreign Lang Req: Irish

FAS Divisional Distribution: Arts and Humanities

Welsh

WELSH 226R

Readings in Middle Welsh Prose

TR 0130 PM - 0245 PM

Course ID: 111956
2025 Fall (4 Credits)

We begin with readings from a selection of Middle Welsh prose texts before moving on to an introduction to Middle Welsh verse, beginning with readings from the englyn poetry.

FAS: Meets Foreign Lang Req: Welsh

FAS Divisional Distribution: Arts and Humanities

WELSH 227

Welsh Bardic Poetry

TR 0130 PM - 0245 PM

Course ID: 111774
2026 Spring (4 Credits)

Readings from a range of Middle Welsh verse texts including poetry from the Book of Taliesin, the Book of Aneirin and the Gogynfeirdd.

Knowledge of Welsh or permission of the instructor.

FAS Divisional Distribution: Arts and Humanities

FAS: Meets Foreign Lang Req: Welsh

Scottish Gaelic

SCTGALIC 130

Introduction to Scottish Gaelic

MTWR 1200 PM - 0115 PM

Natasha Sumner

Course ID: 111042
2025 Fall (4 Credits)

Scottish Gaelic is spoken primarily in communities of the West Highlands and the Hebrides—a group of islands off the west coast of Scotland. There is also a Gaelic community on Cape Breton Island in Nova Scotia. Gaelic language and culture thrive in poetry, fiction, traditional and contemporary music, oral tradition, and a very lively blogosphere. The course introduces students to Scottish Gaelic as it is spoken and written today. It surveys the grammar while also emphasizing practice in speaking the language. Class work is highly participatory; students are encouraged to take part in a range of communicative activities which enhance oral/aural ability. Translation exercises develop skills in the written language. A range of audio/audiovisual materials and online resources is used to support student learning. Meets four times a week.

Course Note: The combination of Scottish Gaelic 130 followed by Scottish Gaelic 131r satisfies the language requirement. It is recommended in any case that this course be followed by Scottish Gaelic 131r. May not be taken Pass/Fail. Not open to auditors. Meets 4 times/weekly.

FAS: Meets Foreign Lang Req: Scottish Gaelic

FAS Divisional Distribution: None

SCTGALIC 131R

Intermediate Scottish Gaelic

MTWR 1200 PM - 0115 PM

Natasha Sumner

Course ID: 113999
2026 Spring (4 Credits)

Direct continuation of the fall term course Scottish Gaelic 130.

Course Note: This course, when taken following Scottish Gaelic 130, satisfies the language requirement. May not be taken Pass/Fail. Not open to auditors.

Scottish Gaelic 130 or equivalent.

FAS: Meets Foreign Lang Req: Scottish Gaelic

Chemical and Physical Biology

Chemical and Physical Biology

CPB 91

Research for Credit in Chemical and Physical Biology

No meeting time listed

Dominic Mao, Monique Brewster

Course ID: 122591
2025 Fall (4 Credits)

Instructor Permission Required

91 is research for credit. It cannot be taken as a fifth course. To be eligible to enroll, you must have a Harvard-affiliated principal investigator agree to mentor you for the semester. For this reason, students must reach out to labs and interview with labs ahead of the start of the semester. Students are expected to work an average of 15 hours/week during term time. Please note, this course is only open to CPB concentrators.

Course Note: Limited to CPB concentrators. Students must have secured a position in a laboratory prior to enrolling in the course; the instructor will verify this with the faculty sponsor. Ordinarily may not be taken as a fifth course. Students must complete basic laboratory safety training and other safety training required by the host lab prior to starting work.

This course can be repeated with permission from the concentration advisors.

FAS Divisional Distribution: Science & Engineering & Applied Science

CPB 99A

Laboratory Research for Honors Thesis

Course ID: 122592
2025 Fall (4 Credits)

No meeting time listed

Instructor Permission Required

Dominic Mao, Monique Brewster

Laboratory research in topics related to the CPB concentration, culminating in an undergraduate thesis submitted to the CPB undergraduate office for review by members of the Board of Tutors in Biochemical Sciences and the greater Boston research community. The course includes a series of workshops designed to help prepare students for the process of writing their thesis.

Course Note: Limited to students writing a thesis in CPB. Students are required to submit a written proposal to the CPB undergraduate office in the summer for review by the Board of Tutors in Biochemical Sciences for enrollment that fall. Only those students whose thesis proposals are approved are eligible to enroll. Ordinarily may not be taken as a fifth course. Students must complete both terms of this course (parts A and B) within the same academic year in order to receive credit. Students must complete basic laboratory safety training and other safety training required by the host lab prior to starting work.

Chemistry and Chemical Biology

Chemistry

CHEM 10 (LEC)

Quantum, Statistical, and Computational Foundations of Chemistry

MWF 1030 AM - 1145 AM

Hongkun Park, Lu Wang

Course ID: 222540

2025 Fall (4 Credits)

Instructor Permission Required

An introduction to the fundamental theories of quantum mechanics and statistical mechanics and their role in governing the behavior of matter. The course begins with the quantum behavior of a single electron and develops the elements of the periodic table, the nature of the chemical bond, the bulk electronic and thermal properties of materials, and the thermodynamics of chemical reactions. Applications include semiconductor electronics, solar energy conversion, medical imaging, and the stability and dynamism of living systems. Calculus and numerical simulations will be used extensively. In the weekly laboratory sections and the final project, students construct technical instruments that they then use in directed and open-ended explorations of the core concepts of the course.

Course Note: The general chemistry requirement for the Chemistry concentration can be met by: one course CHEM 10; or two courses, one being LPS A or LS 1A, and the other being PHYSCI 10 or PHYSCI 11; or satisfactory placement out of the requirement. Students may not count both CHEM 10 and PHYSCI 11 for degree credit. Students may not count both CHEM 10 and PHYSCI 10 for degree credit. CHEM 10 satisfies two semesters of general chemistry with lab for most medical schools; other courses, such as LPSA, LS1a, LS50a, or PS11, count as one semester of general chemistry with lab. Please refer to "Premedical Information for Harvard Students: Timelines, Courses, & Resources" (aka "the Blue Premed Guide") for an overview of courses that meet the academic requirements and application timelines for admission to U.S. medical school, and email premed@fas.harvard.edu with any questions. Enrollment is limited to 30 students. Please see the course Canvas for the petition form and petition process.

A strong background in chemistry (Chemistry AP score of 5, or equivalent preparation), mathematics at the level of Mathematics 1b (may be taken concurrently; some ideas from linear algebra will be introduced in class), and some familiarity with physics (force, energy, work, and electric charge). No coding experience is required. You will learn how to code throughout the course.

FAS Divisional Distribution: Science & Engineering & Applied Science

CHEM 17 (LEC)

Principles of Organic Chemistry

MWF 0130 PM - 0245 PM

Christina Woo, Sirinya Matchacheep

Course ID: 115137

2025 Fall (4 Credits)

An introduction to organic chemistry, with an emphasis on structure and bonding, reaction mechanisms, and chemical reactivity.

Course Note: The Chemistry 17/27 sequence is intended primarily for students in chemistry or the life sciences, who have completed LPSA, LS1a, CHEM 10 or PS11. The Chemistry 20/30 sequence is intended primarily for students planning a concentration in chemistry or the physical sciences. Either sequence satisfies the organic chemistry requirement for medical school. Students may not count both Chemistry 17 and Chemistry 20 for degree credit. On the other hand, Chemistry 27 and Chemistry 30 cover different material, so students interested in taking both courses may choose to do so via one of two sequences: Chemistry 17-27-30 or Chemistry 20-30-27. Chemistry 27 satisfies the biochemistry chemistry requirement for most medical schools.

Students who have taken Chem S-17 have the option to be exempted from the lab component of Chem 17. If students choose to be lab exempt, exams will make up a greater percentage of their final grade. The course syllabus describes the grading scheme in greater detail.

Open to freshmen with a score of 750 or higher in the College Boards or the Chemistry Placement Examination; and to students who scored 5 on the Chemistry Advanced Placement Examination; and to the students who achieved a grade of B or higher in LPSA, LS1a, CHEM 10, PS11, or another college-level introductory chemistry course. Others may enter only by permission of the instructor.

FAS Divisional Distribution: Science & Engineering & Applied Science

Organic Chemistry

MWF 0900 AM - 1015 AM

Richard Liu

An introduction to structure and bonding in organic molecules; mechanisms of organic reactions; chemical transformations of the functional groups of organic chemistry; synthesis; determination of chemical structures by infrared and NMR spectroscopy.

Course Note: Chemistry 20/30 is an integrated two-semester sequence that prepares students to study chemistry and other physical sciences, whereas the Chemistry 17/27 sequence focuses on application of organic chemistry concepts to the life sciences. Either sequence satisfies the organic chemistry requirement for medical school and the chemistry concentration. The content of Chemistry 17 is accelerated and overlaps with topics from both Chemistry 20 and 30. Students may not count both Chemistry 17 and 20 toward the degree. However, Chemistry 27 and Chemistry 20/30 cover different material, so students may choose to take Chemistry 27 after completing the 20/30 sequence.

Open to students who scored 4 or 5 on the Chemistry Advanced Placement Examination, or who successfully completed Life Sciences 1A or Life and Physical Sciences A. Others should contact the instructor to discuss their preparation.

FAS Divisional Distribution: Science & Engineering & Applied Science

Organic Chemistry of Life

MWF 1200 PM - 0115 PM

Brian Liau, Sirinya Matchacheep

Chemical principles that govern the processes driving living systems are illustrated with examples drawn from biochemistry, cell biology, and medicine. The course deals with organic chemical reactivity (reaction mechanisms, structure-reactivity relationships), with topics specifically relevant to the life sciences (chemistry of enzymes, nucleic acids, drugs, natural products, cofactors), and with applications of chemical biology to medicine and biotechnology. An understanding of organic reactions and their "arrow-pushing" mechanisms is required.

Course Note: Students who completed Chem S-17 in Summer 2023 or before have the option to be exempted from the lab component of Chem 27. Similarly, students who have completed both Chem 20 and Chem 30 may be exempted. If students choose to be lab exempt, exams will make up a greater percentage of their final grade. The course syllabus describes the grading scheme in greater detail.

Chemistry 17 or Chemistry 30 or Chemistry 20 with permission of the instructor.

FAS Divisional Distribution: Science & Engineering & Applied Science

Organic Chemistry

TR 1030 AM - 1145 AM

Andrew Myers

Continuation of Chemistry 20 with a greater focus on complex chemical reactivity and challenging problem solving. Carbonyl chemistry and pericyclic reactions are covered in particular detail, using principles of stereochemistry, stereoelectronic theory, and molecular orbital theory as a foundation. Students develop skills in planning organic chemical syntheses and are given an introduction to organometallic chemistry.

Course Note: The course features a problem solving and review session led by Prof. Myers, with a focus on challenging, collaborative problem solving using the week's lecture material. Students are expected to attend both lectures and the review session during the week (Lectures: Tuesday and Thursday, 10:30AM-11:45AM; Problem Session: Friday, Time TBD). In a typical week, there will be one problem set and two lecture integration problems. In addition to problem sets and laboratory work, the course will be assessed over three midterm examinations (1 hour each) and one final examination (3 hours). Office hours and help rooms will be available throughout the week.

Recommended Prep: Chemistry 20 or the equivalent. Chemistry 27 and 30 may both be taken for degree credit. Students who have taken Chemistry 17 are welcome to take the course but should contact the teaching staff to discuss preparations at the start of the semester. Freshmen have taken Chem 30 and excelled at it, but it is recommended that any freshmen considering the course first contact the teaching staff to discuss their background preparation.

CHEM 40 (LEC)**Inorganic Chemistry**

MW 1030 AM - 1145 AM

*Theodore Betley*Course ID: 123126
2026 Spring (4 Credits)

Students will be introduced to the basic concepts of inorganic chemistry. Principles of chemical bonding and molecular structure will be developed on the basis of electronic structure, symmetry, and group theory. These concepts will be applied toward understanding coordination chemistry and organometallic chemistry.

Chemistry 17 or 20

CHEM 100R (LAB)

Experimental Chemistry and Chemical Biology

No meeting time listed

Course ID: 123022
2026 Spring (4 Credits)

Instructor Permission Required

A project-based course, where groups of 2–4 students engage in synthetic organic chemistry research. Students are introduced to experimental problems encountered in the synthesis, isolation, purification, characterization, and identification of potentially therapeutic organic compounds. Throughout the research process, students gain technical proficiency and develop an understanding of both the theory and practice of organic synthesis, and spectroscopy. Students complete problem sets in spectroscopy and use electronic notebooks to keep track of their research findings, which they present in group meetings and write up for publication. Students learn to communicate technically with other scientists and peers.

Course Note: Recommended as preparation for research in synthetic organic chemistry (Chemistry 98R and 99R), or related disciplines. This course is suitable for students with or without extensive laboratory experience.

Chem 20/30, 17/27, or S-20ab; and permission of the instructor.

FAS Divisional Distribution: Science & Engineering & Applied Science

CHEM 105 (LEC)

Advanced Organic Chemistry

TR 0130 PM - 0245 PM

Eric Jacobsen

Course ID: 109454
2025 Fall (4 Credits)

Advanced reactivity principles in organic chemistry. Students learn 1) fundamentals of structure, bonding, and reaction energetics; 2) to identify and propose mechanisms for common organic, organometallic, and catalytic reactions, along with experiments to test those mechanisms; 3) to evaluate the factors controlling rate and selectivity in organic reactions; 4) to understand and analyze the current organic chemistry literature. The overarching goal of this course is to provide students with a solid foundation for a research career in organic chemistry and adjacent fields (chemical biology, inorganic chemistry).

This course requires students to choose timed sections during registration. Sections will begin 30 minutes after the start time shown in my.Harvard, and will be 30 minutes in duration (9:30-10:00 AM and 12:30-1:00 PM).

Two semesters of college-level organic chemistry. At least one prior or concurrent course in physical and/or inorganic chemistry is recommended.

FAS Divisional Distribution: Science & Engineering & Applied Science

CHEM 110 (LEC)

The Chemistry and Biology of Therapeutics

MW 1030 AM - 1145 AM

Matthew Shair

Course ID: 110241
2025 Fall (4 Credits)

This course will cover the chemical and biological principles that govern small molecule therapeutics. We will discuss small molecule conformational analysis, chemical forces that drive small molecule-protein interactions, and small molecule binding to proteins to affect disease states. We will also discuss how protein targets are identified and the frontiers of modern small molecule therapeutics. Protein targets include, but are not limited to kinases, proteases, GTPases, scaffolding proteins, epigenetic modifiers, metabolic enzymes and transcription factors. This course will teach students how to use modern computer modeling applications to perform structure-based design of small molecule ligands.

Course Note: Course Requirements: Completion of Chem 27, Chem 30, or prior instructor approval.

FAS Divisional Distribution: Science & Engineering & Applied Science

CHEM 135 (LAB)

Experimental Synthetic Organic Chemistry

No meeting time listed

Course ID: 112954
2026 Spring (4 Credits)

CHEM 145 (LAB)

Experimental Inorganic Chemistry

TR 1200 PM - 0500 PM

Dilek Dogutan Kiper

Course ID: 109110
2025 Fall (4 Credits)

Instructor Permission Required

Chemistry 145 is a laboratory course designed to introduce students to inorganic laboratory synthesis, purification, and characterization techniques. Students will learn proper and safe techniques for handling and storing air, light, water-sensitive compounds, including the use of an inert-atmosphere glovebox and a Schlenk line. Synthesized compounds will be analyzed by various methods including infrared (IR), Electron Paramagnetic Resonance (EPR), paramagnetic and Nuclear Magnetic Resonance (NMR), and electronic absorption spectroscopies; and electrochemical techniques. Emphasis will be placed on rigorous adherence to the scientific method in the form of neat, comprehensive, clear entries in electronic laboratory notebooks hosted at Harvard Wiki including characterization data. Students will also develop the ability to read, understand, interpret, and explain the primary scientific literature, write research papers as manuscripts, and learn how to use different search engines, such as SciFinder, Web of Science.

Course Note: Class meeting times Tuesday & Thursday 12:00 pm-5:00 pm in Northwest 158

FAS Divisional Distribution: Science & Engineering & Applied Science

CHEM 154 (1)

Advanced Inorganic Chemistry

MW 0900 AM - 1015 AM

Daniel Nocera

Course ID: 126035
2026 Spring (4 Credits)

Instructor Permission Required

The physical inorganic chemistry of transition elements will be discussed. The course will emphasize group theoretical methods of analysis and attendant spectroscopic methods (e.g., electronic, vibrational, EPR, magnetic) derived therefrom. Connections between molecular structure and electronic structure and how that parlay into the properties of complexes and their reactivity will be illustrated throughout various modules, which will touch on advanced problems of interest in the subjects of catalytic, organometallic, coordination, solid state and bioinorganic chemistries.

FAS Divisional Distribution: Science & Engineering & Applied Science

CHEM 156 (LEC)

Materials Chemistry

MW 1030 AM - 1145 AM

Jarad Mason

Course ID: 207680
2025 Fall (4 Credits)

Instructor Permission Required

This course will survey topics in materials chemistry, emphasizing how atomic-level interactions dictate the bulk properties of matter. Basic chemical principles will be applied to discuss the design, synthesis, and characterization of inorganic and organic materials. Specific topics will include: electronic, optical, and magnetic properties of inorganic solids; synthesis and characterization of nanomaterials; microporous solids; gas sorption; and biomaterials. The primary literature will be used to highlight key historical discoveries and significant recent results relevant to each of these areas. Each student will also develop an independent research proposal on a more specialized topic.

Enrollment is limited and by petition only.

Chem 40 (or instructor approval)

CHEM 160 (LEC)**The Quantum World**

MWF 1200 PM - 0115 PM

Joonho Lee

Course ID: 112976

2025 Fall (4 Credits)

Quantum mechanics is the fundamental principle of the microscopic world. Quantum mechanics allows us to understand the motion of electrons, atoms and molecules. Only with such understanding, we can rationally design and engineer quantum materials, in order to realize quantum technologies such as quantum information, quantum sensing, and quantum computation. In this class, you will learn the fundamental postulates of quantum mechanics and their implications for the structure and behavior of atoms and molecules. In particular, we will explore the mathematical framework behind molecular bonding, vibration, and rotation. We will also discuss how to probe the properties of atoms and molecules using tunable electromagnetic radiation, more commonly known as light!

Mathematics 21a or 21b, or equivalent preparation in calculus and differential equations; Physical Sciences 11 or equivalent preparation in chemical bonding and fundamental principles; two introductory physics courses (e.g., Physical Sciences 2 and Physical Sciences 3).

FAS Divisional Distribution: Science & Engineering & Applied Science

CHEM 161 (LEC)**Statistical Thermodynamics**

MW 1200 PM - 0115 PM

Xiaowei Zhuang

Course ID: 113217

2026 Spring (4 Credits)

An introduction to statistical mechanics, thermodynamics, and chemical kinetics with applications to problems in chemistry and biology.

Chemistry 160 or Physics 143a, or equivalent. Math 21a, or equivalent.

FAS Divisional Distribution: Science & Engineering & Applied Science

CHEM 165 (LAB)**Experimental Physical Chemistry**

No meeting time listed

Khaled Abdelazim

Course ID: 119035

2026 Spring (4 Credits)

Instructor Permission Required

The goal of this course is to provide students with both detailed knowledge of established and fundamental methods of experimental physical chemistry and an introduction to selected state-of-the-art experiments that address contemporary scientific questions. You will learn about tools that are of broad utility in many areas of science and have fun discovering how to make these experimental apparatus work. The fundamental methods discussions will demonstrate how specific chemical phenomena can be used to interrogate complex molecular systems. Some of the experimental techniques introduced in this class are now employed in many different fields of fundamental and applied science and are considered the often cornerstones of modern day experimental nanoscience. The class will provide a hands-on introduction to physical methods and techniques used widely in chemistry and chemical physics research laboratories. Computer-based methods of data acquisition and analysis are used throughout.

Course Note: Recommended as preparation for research in experimental chemistry (Chemistry 98R and 99R), chemical physics, engineering sciences, or related disciplines.

Physical Sciences 11 or equivalent preparation in chemical bonding and fundamental principles; two introductory physics courses (e.g., Physical Sciences 2 and Physical Sciences 3). Chem 160 is recommended but not strictly required.

FAS Divisional Distribution: Science & Engineering & Applied Science

CHEM 166 (1)**Quantum Materials, Where Physics and Chemistry Meet**

MW 1200 PM - 0115 PM

Course ID: 223111

2026 Spring (4 Credits)

Instructor Permission Required

Suyang Xu

The discoveries of new materials have been so definitive that they are used to name periods in the history of mankind, such as Stone Age, Bronze Age, Iron Age, and Silicon Age. As we enter the quantum era, research focuses on Quantum Materials, where quantum mechanical effects are pronounced, holding promising for quantum computer, space technology, and clean energy. In this class, we will teach you the quantum theory of crystalline materials, including the cutting-edge quantum materials such as superconductors, magnets, topological insulators, light-harvesting materials, etc. We will teach these from a chemistry perspective, i.e., by drawing orbitals, chemical bonds and electron clouds in real space, in contrast to the typical quantum theory of solids in physics (solving Hamiltonians in momentum space). For chemistry and engineering students, we hope this class can teach you solid state theory without being bogged down by heavy math. For physics student, we hope this class can help you to establish a real space intuition for many of the concepts, which are lacking in present education. Overall, we hope to teach you the research frontiers in quantum science entered on materials discovery.

Recommended Prep: Chem 160 (The Quantum World) or an equivalent quantum mechanics course.

FAS Divisional Distribution: Science & Engineering & Applied Science

CHEM 171 (LEC)

Biological Synthesis

TR 0130 PM - 0245 PM

Emily Balskus

This course will examine synthesis from a biological perspective, focusing on how organisms construct and manipulate metabolites, as well as how biological catalysts and systems can be used for small molecule production. Topics to be covered include mechanistic enzymology, biosynthetic pathways and logic, biocatalysis, protein engineering, and synthetic biology.

FAS Divisional Distribution: Science & Engineering & Applied Science

2026 Spring (4 Credits)

CHEM 177 (LEC)

The Chemistry, Biology, and Societal Implications of Genome Editing

F 0300 PM - 0545 PM

David Liu

The life sciences and medicine are undergoing a revolution stimulated by breakthrough advances in genome editing technologies. These technologies, including those enabled by CRISPR systems, enable researchers and physicians to modify target DNA sequences in the genomes of living cells, including those in plants, animals, and human patients. This class will overview the chemistry and biology underlying recent and current genome editing agents. We will also discuss their current limitations, how they are reshaping medicine and agriculture, and some social and ethical implications of their use. In addition to attending lectures that present the chemistry and biology of genome editing, students will analyze recent reports from the scientific literature, and will present their analyses and reasoned opinions during the semester. Participants will also develop and present final projects on an aspect of genome editing to the class at the end of the semester.

Enrollment is limited and by petition only. For full consideration, submit an enrollment petition by following the directions posted on the course Canvas site.

For advanced undergraduates and graduate students with undergraduate-level understanding of molecular biology and either organic chemistry or biochemistry.

Quantum Mechanics for Physical Chemistry

TR 0130 PM - 0245 PM

Eric Heller

Course ID: 112103

2025 Fall (4 Credits)

Instructor Permission Required

This course is designed to develop a familiarity and intuition for quantum mechanics, both time dependent and time independent. Emphasis on applications to spectroscopy and dynamics of large molecules, scattering theory, ultracold collisions, classical and semiclassical methods and their connection to quantum mechanics, decoherence theory and quantum measurement theory, and more topic to be determined by circumstance and student interests.

Enrollment is limited and by petition only. This course includes a required discussion section. Section will be scheduled in August, after polling enrolled students for their availability.

This should not be your first exposure to quantum mechanics but a good undergrad course in quantum mechanics and calculus plus some familiarity with differential equations is sufficient.

FAS Divisional Distribution: Science & Engineering & Applied Science

CHEM 243 (LEC)

Quantum Molecular Physics and Chemistry

MW 0300 PM - 0415 PM

Kang-Kuen Ni

Course ID: 134095

2026 Spring (4 Credits)

A graduate-level course on modern developments and techniques to control polar molecules for quantum science. The objective is to make students familiar with current research on using diatomic and polyatomic molecules for quantum computation, chemistry, simulation, and precision measurements. We will first lay the groundwork on angular momentum, spherical tensors, and rotations between frames. Main topics include molecular structure, dipolar interactions in the context of collisions and long-range entanglement, and trapping, cooling, and controlling techniques using external fields. Familiarity at the level of an introductory graduate quantum mechanics course is assumed.

Course Note: This course is also offered as QSE 243 and PHYSICS 243. Students may only take one of PHYSICS 243, QSE 243, and CHEM 243 for credit

Advanced Statistical Mechanics: Frontiers in Research

TR 0300 PM - 0415 PM

Eugene Shakhnovich

Course ID: 222893

2025 Fall (4 Credits)

Instructor Permission Required

This class is for students who have undergraduate-level background in statistical mechanics but would like to explore how statistical mechanics helps to expand frontiers of research in modern biophysical chemistry, systems biology and materials science. The course includes regular lectures and journal club style in-depth discussion of current literature. The course starts with introductory lectures with emphasis on statistical mechanics of complex multi-particle systems including theory of phase transitions, statistical mechanics of complex systems and related topics. Next, we proceed with discussion of topics at the forefront of current

research. These include but not limited to biomolecular folding and organization including protein and genome folding and assembly of supramolecular complexes, statistical mechanics of liquid-liquid phase separation in living cells, statistical mechanics of biological evolution, thermal and dynamic properties of complex materials (polymers, gels multicomponent solutions). Special emphasis will be placed on current developments that revolutionized life sciences such as application of artificial intelligence in structural biology (AlphaFold2) and AI-based approaches to computational drug discovery

Enrollment is limited and by petition only. This course includes a required discussion section. Section will be scheduled in August, after polling enrolled students for their availability.

Practical Crystallography in Chemistry and Materials Science

2026 Spring (4 Credits)

TR 1030 AM - 1145 AM

Instructor Permission Required

Shao-Liang Zheng

Due to great technical advances, crystal structure analysis plays an increasingly important role in the structure determination of complex solids. This course involves the basic principles of crystallography and covers advanced aspects of practical crystal structure refinement. Topics include crystal symmetry, space groups, geometry of diffraction, structure factors, and structure refinement. Students will gain a working knowledge of x-ray crystallographic techniques, including how to: grow quality crystals, collect data, reduce data, determine a structure, visualize structure, utilize structural databases, publish crystallographic results. Watch Learning Crystal Structure Analysis at Harvard.

PHYSCI 11 (LEC)

Foundations and Frontiers of Modern Chemistry: A Molecular and Global Perspective

Course ID: 107368
2026 Spring (4 Credits)

MWF 1030 AM - 1145 AM

Gregory C. Tucci, Frank Keutsch, Amanda Spiewak

The Physical Sciences hold the key to solving unprecedented problems at the intersection of science, technology, and an array of rapidly emerging global scale challenges. The course emphasizes a molecular scale understanding of energy and entropy; free energy in equilibria, acid/base reactivity, and electrochemistry; molecular bonding and kinetics; catalysis in organic and inorganic systems; the union of quantum mechanics, nanostructures, and photovoltaics; and the analysis of nuclear energy. Case studies are used both to develop quantitative reasoning and to directly link these principles to global strategies.

Course Note: Courses accepted by most medical schools as one semester of general chemistry with lab are LPS A, LS 1A, LS50a, or PHYSCI 11. The general chemistry requirement for the Chemistry concentration can be met by: one course CHEM 10; or two courses, one being LPS A or LS 1A, and the other being PHYSCI 10 or PHYSCI 11; or satisfactory placement out of the requirement. Students may not count both CHEM 10 and PHYSCI 11 for degree credit. Physical Sciences 1 and Physical Sciences 11 cannot both be taken for credit.

A few operations of calculus are developed and used. Fluency in pre-calculus secondary school mathematics is assumed.

Students are expected to have high school chemistry, or have completed Life and Physical Sciences A (LPS A) or Life Sciences 1a (LS 1a), or have received permission of the instructors.

FAS Divisional Distribution: Science & Engineering & Applied Science

LPS A (LEC)

Course ID: 123833
2025 Fall (4 Credits)

Foundational Chemistry and Biology

MWF 0900 AM - 1015 AM

Gregory C. Tucci, Monica Boselli, Maria Ostapovich, Amanda Spiewak, Amanda Spiewak

This course introduces fundamental concepts in chemistry and biology. Topics in chemistry include stoichiometry, acids and bases, aqueous solutions, gases, thermochemistry, electrons in atoms, and chemical bonding. The course also examines biological molecules, the transfer of information from DNA to RNA to protein, and cell structure and signaling.

Course Note: For students with little or no previous study of chemistry or biology. This course assumes fluency with high school algebra. LPS A gives solid preparation for Life Sciences 1b and Physical Sciences 11.

Requires: Anti-req: Cannot be taken for credit if Life Sciences 1a, OR Physical Sciences 1, OR Physical Sciences 10, OR Physical Sciences 11, OR Chemistry 17 OR Chemistry 20 already complete

Course ID: 226297

2025 Fall (4 Credits)

Instructor Permission Required

From the enslaved poet Phillis Wheatley writing in Boston in the 1760s and 1770s, to contemporary authors and artists in Africa, the Caribbean, and the US, this lecture course will explore uses of ancient Greek and Roman Classics in the literatures, arts, and thought of Africa and the Black Diaspora. We will analyze how African and black diasporic authors and intellectuals have engaged with, revised, and re-imagined the classics of ancient Greece and Rome, both to expose and critique discourses of racism, imperialism, colonialism, and white supremacy, and as a rich source of radical self-expression. The course will be arranged thematically, taking in uses of Classics in literature, art, journalism, and politics. Writers, artists, and politicians whose work and ideas we will study include Phillis Wheatley, William Sanders Scarborough, Anna Julia Cooper, Pauline Hopkins, Mary Church Terrell, Edmonia Lewis, W.E.B. Du Bois, Aaron Douglas, Romare Bearden, Bob Thompson, Gwendolyn Brooks, Ralph Ellison, Rev. Martin Luther King Jr., Toni Morrison, Rita Dove, Harryette Mullen, Spike Lee, Hastings Kamuzu Banda, Ola Rotimi, Athol Fugard, John Kani, and Winston Ntshona, Wole Soyinka, Njabulo Ndebele, C.L.R. James, Eric Williams, Aimé Césaire, Derek Walcott, Kamau Brathwaite, Austin Clarke, Marlene NourbaSe Philip, Dionne Brand, and Evie Shockley. In addition to works by individual authors, lectures will also attend to the circulation of Greek and Roman classical myths, history, and thought in vernacular cultures. Throughout, we will be attentive to the relationship between national contexts and transnational histories and networks, and the phenomenon of classical appropriation in invented modern traditions.

Greek

GREEK 1

Course ID: 203024
2025 Fall (4 Credits)

Introductory Ancient Greek 1

MWF 0900 AM - 1015 AM

Nadav Asraf

Greek 1 is the starting point for those interested in learning Ancient Greek. You will be introduced to the Ancient Greek world and culture through its language and literature. The specific dialect studied is that of Classical Athens, which is the language of Plato, Euripides, and Thucydides, as well as the basis for the language of the New Testament. The course also includes various enrichment activities, such as visits to museums and libraries.

Course Note: Students wishing to continue after Greek 1 should proceed to Greek 2, which continues the introductory sequence and prepares students for Greek 3.

No auditors. May be taken pass/fail (undergraduates) or SAT/UNSAT (graduate students) with instructor permission.

None. Greek 1 is an introductory course for students with no prior experience. Those who have studied Greek formally are not permitted to enroll in Greek 1, but should instead consider Greek 3; please consult with the Senior Preceptor in Classics (<mailto:livings@g.harvard.edu>).

Introduction to Ancient Greek Literature

MWF 0130 PM - 0245 PM

Nadav Asraf

Greek 10 is dedicated to close reading and analysis of Ancient Greek literary texts, both prose and poetry, beginning at an intermediate pace. You will hone your Ancient Greek linguistic skills by reading authentic texts (e.g., Plato, Euripides, Homer, and Herodotus) and thereby improve your command of the language. By reading original Ancient Greek texts you will also be introduced to the literature and culture of Ancient Greece, while developing an appreciation for features of style, genre, and meter. The course will also include various enrichment activities, such as visits to museums and libraries.

Course Note: After Greek 10, students may take Greek courses at the 100-level, but are encouraged to consult with the Director of Undergraduate Studies in the Classics (classicsDUS@fas.harvard.edu) about their choice of course. Students may also take Greek 10 more than once, with the permission of the course head. Auditors allowed with permission of course head.

FAS: Meets Foreign Lang Req: Ancient Greek

HCOL: Foreign Lang Citation: Ancient Greek

GREEK 131

Pindar

MW 1200 PM - 0115 PM

Gregory Nagy

This course focuses on songs of Pindar that were composed to celebrate the victories of athletes who competed in athletic events that took place at the Olympics in Olympia and at other such seasonally recurring festivals. Such songs, known to classicists as "epinician poems" or "victory odes," were usually performed in the victorious athlete's native city. The poet Pindar, whose career coincides with the first half of the fifth century BCE, was a "star" composer of such victory odes, and it was a matter of stratospheric prestige for the family of a victorious athlete to succeed in commissioning Pindar to compose for their native son such a celebratory song. The odes to be read in the original Greek for this course will include selections that all students will be reading, balanced with further selections chosen by each student. The amount of reading will be variable, adjusted to each student's degree of preparation. For example, those who have already studied Homeric poetry will be able to read more, but those students without such background can catch up rapidly, with the professor's one-on-one help. To be studied in the course is not only the poetic language of Pindar but also the historical background of athletic festivals and of elitist as well as non-elitist ideologies linking the heroic past as a model for athletes—including women athletes. A book that will be consulted in analyzing the historical background of female as well as male athleticism is the professor's recent book *Ancient Greek Heroes, Athletes, Poetry* (2024). Pindar's poetry, especially with reference to the hero Herakles, figures most prominently in that book. Other heroes highlighted in Pindar's poetry include the tragic figure of Ajax, as analyzed in another book written by the professor: *Imagining the hero Ajax in poetry by Pindar and by Pindar's Homer* (2024).

GREEK 175

Greek Syntax and Style

T 1245 PM - 0245 PM

Mark Schiefsky

Greek 175 is an advanced course in Ancient Greek that aims to give students a deeper understanding of the structure and use of Greek. Students will have the opportunity to improve their knowledge of the language thanks to an advanced review of morphology, syntax, and semantics, and to challenge themselves through discussions of finer points of semantics, word order, particles, and rhetorical devices. The students' command of the language will be tested and refined by way of exercises in translating from English into Classical Greek and exercises which, coupled with reading representative authors and commenting on their use of Greek, will give will give them a deeper appreciation for the structure of the language and the inner workings and style of Greek prose.

Undergraduates with sufficient preparation in Greek (the equivalent of at least one 100-level course) are welcome to enroll. Interested students should contact the instructor for more information.

HCOL: Foreign Lang Citation: Ancient Greek

GREEK 188

Oratory

TR 1030 AM - 1145 AM

Alexander Riehle

In the largely oral societies of the ancient Mediterranean world, speech held an important place in public discourse. The delivery of orations and informal discourses could serve various purposes: to establish communication between individuals or groups, to influence decision-making in assemblies and courts, to support and spread political propaganda, to forge and represent collective identities, and to promote personal agendas. Particularly in later periods, rhetorical displays could turn into public spectacles comparable to dramatic performances. This class traces the history of Greek oratory from the classical period to late antiquity by reading representative texts in various rhetorical genres and discussing them within their socio-political contexts. In addition to canonical orators of classical Athens such as Demosthenes, Lysias, and Isocrates, we will also study examples of Roman and late antique (including Jewish and Christian) rhetoric.

Greek Archaeology

TR 0130 PM - 0245 PM

Adrian Staehli

This course offers an introduction to Greek art, architecture, and material culture from the end of the Mycenaean civilization (ca. 1200/1100 BC) to the Hellenistic Age (3rd–1st century BC) and the Roman conquest of Greece. It surveys in chronological order sites, monuments, art works and artefacts of ancient Greece from the "Dark Ages" through the Archaic, Classical, and Hellenistic period. Attention will be given to archaeological remains and material culture as evidence for social and cultural historical processes and to their importance for our understanding of the ancient Greek world, but also to the reception of Greek art and architecture in modern times, with a particular focus on American neo-classical architecture and sculpture. The course provides broad knowledge of the major monuments and artefacts of ancient Greece in a chronological survey and examines archaeological methods, theories and practices, including issues of current research and scholarly debates. Participants will learn in the class room and through museum visits to identify, classify, and interpret archaeological artefacts and work of arts within their geographical, historical and cultural setting.

Course Note: This course is specifically designed for undergraduates; graduate students are more than welcome, but the course does not count towards the Classical Archaeology course requirements for graduate students in the Classics.

The Archaeology of Women and Gender in the Ancient World

R 0300 PM - 0500 PM

Margaret Andrews

Women represent half of humanity, but they have been greatly underrepresented in studies of past cultures and societies. This course provides an introduction to material aspects of women's lives in the ancient Greco-Roman Mediterranean world: the things and spaces that made up their lives. We will examine not only what women actually did and did not do in these societies, but also how they were perceived by their male contemporaries and what value to society they were perceived to have. Through a comparative and interdisciplinary approach using primarily archaeological evidence, we will explore the complexities and ambiguities of women's lives in the ancient Mediterranean and begin to understand the roots of modern conceptions and perceptions of women in the Western world today.

2025 Fall (4 Credits)

The Roman Villa

W 0300 PM - 0500 PM

Adrian Staehli

In their villas, members of the Roman aristocracy indulged in a lifestyle of leisure and luxury, cultivated their passions for art, literature, scholarship or fish breeding, and refrained deliberately from business and political activities. The course explores the archaeological remains and artifacts—architecture, wall paintings, collections of sculpture, precious silver and gold ware—related to this particular Roman phenomenon of the so-called *villeggiatura*.

CLASARCH 225

Hellenistic Sculpture

F 0300 PM - 0500 PM

Adrian Staehli

Course ID: 207705
2026 Spring (4 Credits)

Greek sculpture of the Hellenistic period (i.e. from the end of the 4th to the 1st century BC) has become again, in recent years, an exciting area of research with a renewed focus on questions of the spatial setting and staging of sculpture, the involvement of the beholder, the manipulation of the experience of perception through specific artistic means that play with appearance and reality, with mimetic illusion and deception, and with new modes of expression and visual narration, which responded to expectations of beholders familiar with new, sophisticated ideas of aesthetic experience which we see reflected in contemporary ekphrastic poetry.

Course Note: This course will be designed in connection and cooperation with the major exhibition on Celtic Art which will be staged by the Harvard Art Museums in Spring 2026 and will include frequent museum trips to the Harvard Art Museums as well as to the Museum of Fine Arts in Boston to study important art works relating to this class.

This seminar addresses primarily graduate students; undergraduate students with previous exposure to Classical Archaeology, Classical Philology, or Ancient History are more than welcome.

2025 Fall (4 Credits)

Livy and the Gauls

MW 1200 PM - 0115 PM

Rachel Love

As Rome expanded beyond the Italian peninsula, the new empire came into contact with their earliest and longest enduring enemy: the Gauls. In this course, we will read how the Latin historian Livy narrates a series of Rome's interactions with several Gallic tribes across a vast swath of modern-day Europe and Asia (e.g. northern Italy, France, Germany, and Turkey). Throughout our reading, we will pay special attention to Livy's use of the ancient ethnographic tradition and support our Latin readings with modern scholarship on historiography and racecraft. This class will meet twice a week. The expected reading load is ca. 3 OCT pages per week, plus weekly English readings of ca. 25 pages. Class time will be split between resolving questions of translation and group discussion of Latin and English readings.

Latin 10 or equivalent experience; please consult with the Senior Preceptor in Classics, Dr. Ivy Livingston: (<[a href="mailto:livings@g.harvard.edu">livings@g.harvard.edu](mailto:livings@g.harvard.edu)).

Latin Didactic Poetry

TR 0900 AM - 1015 AM

Peter Osorio

Course ID: 226514
2025 Fall (4 Credits)

A survey of Republican and Imperial didactic poetry. This year, we will read from Lucretius's *De rerum natura* 4 and Ovid's *Remedia amoris* and *Fasti* 4. All three belong to a long tradition of attempts to work out the relations between love and learning. We will consider how Lucretius and Ovid position their attitudes towards love as a distraction from and/or a driving impulse for inquiry. Along the way we will work on building facility in vocabulary, grammar, and prosody. We will also read relevant comparanda in translation, including excerpts from Hesiod, Plato, Cicero, American Shakers, Anne Carson, Richard Rorty, and others.

Latin 10 or equivalent experience; please consult with the Senior Preceptor in Classics, Dr. Ivy Livingston: (livings@g.harvard.edu).

Introduction to the Ancient Greek World

MW 0130 PM - 0245 PM

Kathleen Garland

This course will cover the history of ancient Greece from the Bronze Age Minoan and Mycenaean palace civilizations to the Roman conquest of the East Mediterranean. Attention will be paid to the major political, social, economic, and cultural transformations, all set within their Mediterranean and west Asian environments. Students will explore the wide variety of textual sources (in translation) and archaeological evidence out of which historians seek to understand ancient Greece.

Course Note: Concentrators are required to take either one or two semesters of Classical Studies 97, depending on their concentration track.

Introduction to the Ancient Roman World

TR 1030 AM - 1145 AM

Irene Soto Marin

This course provides a comprehensive exploration of Roman history, culture, and research methodologies. It consists of three key components: a chronological survey of Roman history, beginning with the founding of Rome in the mid-8th century BCE and concluding with the dissolution of the Western Empire in the late 5th century CE; thematic examinations of crucial aspects of Roman culture and daily life, encompassing topics such as religion, economy, law and administration, technological advancements, and urban topography; and an introduction to the tools and methods utilized in Roman world research, with particular emphasis on material culture and documentary sources. The course aims to provide a robust understanding of both the historical trajectory of Rome and the intricate workings of Roman society. Students will gain valuable insights into the processes of historical inquiry through the study of physical evidence, such as artifacts and archaeological remains, as well as written records, fostering a multifaceted approach to understanding the ancient world.

Course Note: Concentrators are required to take either one or two semesters of Classical Studies 97, depending on their concentration track.

Ancient Myth and the Modern World

W 0945 AM - 1145 AM

Kathleen Garland

This course is an introduction to the study of Greco-Roman mythology. Our primary goal will be to familiarize ourselves with some of the core texts that form this tradition. As we become "mythologically literate" in this extended universe, we will also pursue our second goal, surveying how modern readers have approached and responded to these myths. We will consider how the same set of myths can mean radically different things to different people in different periods, and how they have been appropriated to speak to contemporary concerns. At the same time, we will be looking for commonalities across the different instantiations of these myths, as we attempt to answer the more general questions, "What is myth?" and "What does myth mean to us today?"

CLS-STDY 112

Regional Study: Sicily

R 1245 PM - 0245 PM

Margaret Andrews

Course ID: 156313
2026 Spring (4 Credits)

Instructor Permission Required

The advanced undergraduate seminar Classical Studies 112: Regional Study is a capstone course required of concentrators in Classical Civilizations and Ancient History (Greek and Roman). It will explore in depth the cultural, political, and social histories of ancient Sicily, from the Bronze Age to the Norman period, drawing together the different skills and knowledge that you will have acquired during your time as a concentrator. Through the study of sites, objects, and texts, the course will examine a number of themes key to understanding a discrete region of the ancient Mediterranean world, including landscape and ecology; identities and ethnic interactions; empire and government; religion and myth; and much else. We will aim to analyze all available types of evidence, including architecture, art, coins, geology, inscriptions, and literature. Students will travel to Sicily during Spring Break.

Course Note: This course is required for concentrators in the Classical Civilizations track, joint concentrators in Ancient History, and all joint concentrators in Classical Civilizations and an Allied Field. Admission is by application only. Students interested in enrolling should contact the Director of Undergraduate Studies (classicsDUS@fas.harvard.edu).

CLS-STDY 114

Constantinople

T 1200 PM - 0200 PM

Alexander Riehle

Course ID: 226195
2025 Fall (4 Credits)

Overlooking the Bosphorus Strait, which separates Europe from Asia, the city founded by Constantine I in 324 at the location of ancient Byzantium would become the capital of the Roman Empire, a bustling medieval metropolis, and a site of rich imagination: to the Byzantines it was the "New Rome" or simply "the City," foreigners it inspired with awe and admiration. This seminar explores the city of Constantinople as a physical and mental space by examining archaeological remains and textual and visual sources. We will discuss the city's geography and topography; its place in imperial and religious ideology; private and public institutions such as schools, hospitals, and orphanages; daily life, economy, commerce, and demographics; the excavation, preservation, and transformation of monuments; and native, foreign, and modern-day perceptions.

CLS-STDY 166

Bob Dylan the Classic

TR 1030 AM - 1145 AM

Richard Thomas

Course ID: 222226
2025 Fall (4 Credits)

Instructor Permission Required

This course examines Bob Dylan the creative genius and enduring and continuing musical, literary, and general cultural phenomenon, in the context of popular and higher literary culture of the last 60 years, and of performed literature; also in the context of those long-lived literary and musical cultures with which he works: the Beats and Moderns of the 20th and Romantics of the 19th century; Poe, Melville, Whitman and Americana of the same 19th century; Shakespeare and the old ballad traditions; John Donne and the Metaphysical poets; Dante, Petrarch and the Troubadours; and in more recent songs going back to Homer, Virgil, Ovid, and the western literary canon. Traces the evolution of his songs and lyrics from their early folk, blues, rock, gospel, and protest roots, through the transition from acoustic to electric, in studio and performative contexts, also through the many persona evolutions and reinventions that have characterized and continue to characterize his career in songwriting, performance, literature, film and painting. Lectures, listening to, viewing, and discussing a broad representation of Dylan's output.

This course has an enrollment cap. When you submit an enrollment petition, in the text field please note your concentration (if you have declared one) and write in no more than 50 words/two sentences why you would like to take this course. This course will have a section. Section scheduling preferences will be collected after enrollment closes.

None.

CLS-STDY 172

Romanness after Rome

F 0945 AM - 1145 AM

*Jan Ziolkowski*Course ID: 222227
2025 Fall (4 Credits)

By determining and interpreting facts from roughly 753 BCE to the present, this course explores major issues relating to Rome and Romanness. Self-definition, ethnicity, and identity can be fascinating, especially when probed by looking at people from different times and places. Self-discovery is enriched by fresh learning, together with discovery of others. In a sense, there is only one Rome, and it has been styled eternal. At the same time, many Romes have existed. To start at the beginning, why were the Romans called Roman? What was it to be a Roman citizen? Moving on to Late Antiquity and beyond, let's look at why there was a New Rome or Second Rome, and why it is fair or unfair to talk about Byzantine culture. A related puzzle, why does the thirteenth-century Islamic poet and mystic Rumi have that epithet? To turn to religion, we have the expression Roman Catholic. In matters of Church and State, why was the Holy Roman Empire Roman? Incidentally, what makes Roman Law Roman? Why did Romans speak Latin—or did they all speak Latin? Why did other languages develop that have been termed Romance? Why do some fictions qualify as romances? Why are feelings associated with love romantic? Why does a kind of art and architecture go by the adjective Romanesque? A few big, overarching questions: What claims to Romanness have been made for the US? Why was there a Third Rome—and where was (or is) it? Which has been more Roman, Russia or America—and is that good, bad, or neutral? What is Roman today?

The Economy of Roman Alexandria

R 0300 PM - 0500 PM

*Irene Soto Marin*Course ID: 226198
2026 Spring (4 Credits)

This course explores the vibrant and interconnected economy of Roman Alexandria, emphasizing its role as both a producer of goods and knowledge, as well as a central player in long-distance trade. Students will delve into the city's diverse industries, including the production of textiles, fine arts, and jewelry, alongside the redistribution of essential goods such as grain, rope, and luxury imports like pepper. The course will also examine Alexandria's significant contributions to science, medicine, and philosophy, as well as its political influence, with the urban elite holding land across Egypt and maintaining strong ties with the Roman Emperor and court. Alexandria's strategic location further established it as a vital gateway to the Red Sea, facilitating trade routes to the Horn of Africa, the Arabian Peninsula, and the Indian Ocean, promoting extensive cultural exchange. Through the study of papyri, archaeological findings, coins, and literary sources, this course highlights Alexandria's unparalleled status as a cosmopolitan center of culture, commerce, and intellectual activity during the Roman period.

CLS-STDY 194

Sports and Athletics in Ancient Greece and Rome

T 1245 PM - 0245 PM

*Mark Schiefsky*Course ID: 226199
2026 Spring (4 Credits)

A study of athletics and sport in the ancient Greek and Roman worlds. Through a close study of primary sources (in English), modern secondary literature, and ancient archaeological evidence, the course explores the origins and development of the major ancient athletic contests (particularly the Olympic Games); the theory and practice of athletic training; the relationship between athletics and other forms of bodily care, such as medicine; and the

changing relationship of athletics and education in ancient and modern times. Students will make use of materials in the Harvard Art Museums and the archaeological excavations in ancient Olympia. No prior knowledge of the ancient world is assumed.

Course Note: Some of the lecture sessions may take place over Zoom. All sections will be held in person. Please consult the course site for more details.

This class will have a discussion section. Students should add the untimed placeholder (DIS), and sectioning preferences will be collected after registration.

Translations and Negotiations: the Afterlife of the Roman Landscape

2025 Fall (4 Credits)

R 0900 AM - 1145 AM

Instructor Permission Required

Kaja Tally-Schumacher

This course investigates the myriad ways ancient Roman place-making, visual culture, and thought have been evoked, utilized, weaponized, and translated in North American thought, design, and visual history. Our investigation juxtaposes well established connections between White Supremacy and the Classical Past with often overlooked Indigenous and Black engagement with classical forms. At the heart of our investigation are concepts of agency, ownership, and power, i.e. who shapes the land and who owns the classical forms? Topics explored include the following: the way Indigenous and Black artists, thinkers, and designers have engaged with and translated classical visual practices and concepts (such as Edmonia Lewis and Kent Monkman); Neoclassicism and White Supremacy (i.e. who owns the classical past in public parks? The question of Robert E. Lee/Marcus Aurelius); the entanglement between working the land and enslavement and the parallels and divergences between Roman and New World enslavement; the influence of Roman landscape design and horticulture on later American landscapes and gardens; the legacy of Roman surveying methods and centuriation in the mapping of the US; imperialism and the construction of the Other (Neoclassical portrayals of Indigenous figures in civic spaces in the guise of ancient Mediterranean barbarians); the translation and adoption of ancient Mediterranean and Roman visual culture in American cemeteries (including a class visit to Mount Auburn Cemetery). Class visits: Mount Auburn Cemetery (reached via public transportation) and the Harvard Map Collection.

Students must attend the first class meeting to maintain enrollment in this course. This GSD seminar (HIS 4521) is jointly offered with FAS as HAA 234G and CLS-STDY 224. Enrollment in each offering is capped but may be adjusted to account for student interest.

Dreams and Literature from Antiquity to Modernity

T 0945 AM - 1145 AM

Panagiotis Roilos

Course ID: 226200
2026 Spring (4 Credits)

Against the dual background of ancient and medieval commentaries on the one hand, and modern psychoanalytic and ethnographic studies on the other, diverse literary texts will be explored. The major focus will be on Greek literature from antiquity to the present, but examples from other European literatures will also be considered (including film). Major topics: typology of dreams; dreams as narratives; dreaming and writing; religious dimensions. Theoretical readings to include: Aristotle, Aelius Aristides, Artemidorus, Synesius of Cyrene; Freud, Jung, Levi-Strauss, Lacan, Foucault, Lyotard.

MEDLATIN 110

Introduction to Medieval Latin Literary Culture: Texts and Contexts

M 0300 PM - 0500 PM

Jan Ziolkowski

Course ID: 107676
2025 Fall (4 Credits)

The construct of Europe did not exist until 1600. Medieval Latin culture, omnis Latinitas, merged Greece and Rome, and absorbed elements of Judaism as Romanness was Christianized. Scandinavia and the Baltic were converted, Latinized, and made literate, after 1000. From being defensive, Western Christendom went on the offense. Spain was reconquered. Latin culture reached North Africa, Asia Minor, and the Mideast. The main cultural medium was the codex. Manuscripts distinguish the Middle Ages from papyrus scrolls and printed books. Latin was the main language for them. Look at the course title: text and context come from the Latin Middle Ages, introduction, medieval, Latin, literary, and culture from Latinity. This course samples verse and prose, lyric, epic, comedy, biography, commentary, and theology, from late antiquity to early modernity. It explores monks and mystics, saints and sinners, women writers, Alexander the Great and King Arthur, Charlemagne and Germanic heroes, Thomas Aquinas and scholasticism, and courts and universities. It attends to Medieval Latin studies as field, philology as discipline, and recent theories. The objective is deeper understanding of the past, wherever that leads.

Course Note: Intended for students of the Classics as well as for students of any aspect of the Middle Ages.

Latin 10, Medieval Latin 10, or equivalent experience; please consult with the Senior Preceptor in the Classics (livings@g.harvard.edu).

Instructor Permission Required

This class aims to provide a basic introduction for beginning graduate students to the history, methods, and theories of Classics. Students will have the opportunity to learn about the specialized subfields and material resources pertinent to the study of ancient Greece and Rome at Harvard and beyond. In addition, the course lays a solid foundation for a thriving graduate career by introducing students to the wider network of resources, programs, and research cultures available to GSAS students.

Course Note: For new students working toward the PhD in the Department of the Classics. Open to other students by permission of instructor.

Movement and Migration in the Ancient Mediterranean

T 0945 AM - 1145 AM

Margaret Andrews, Giovanni Bazzana

Course ID: 215990
2026 Spring (4 Credits)

Instructor Permission Required

People often have a hard time staying put, and this course asks why. It will scrutinize the phenomena of movement, mobility, and migration across the ancient Mediterranean world through textual, visual, and material evidence. It will look at both individual and collective movement and the various stimuli that encouraged both. Religion will feature prominently, as we study sanctuaries, ceremonies, and rituals that inspired movement or mobility at either the local, regional, or imperial level. More social questions related to migration will examine the historical evidence for large-scale demographic displacement and its causes, but we will also incorporate relevant data produced by recent advances in archaeological science. By focusing on movement and migration in the ancient Mediterranean, this course provides an interdisciplinary, multi-methodological introduction to a significant aspect of human societies, both ancient and modern. The seminar will invite graduate students to reflect on the pedagogical challenge of constructing a course geared towards undergraduates on the theme of the class (by focusing on hands-on exercises about instructional choices, syllabus construction, assignment selection, and so on).

Tutorial - Sophomore Year

T 0945 AM - 1145 AM

Matylda Figlerowicz

Course ID: 114038
2026 Spring (4 Credits)

Instructor Permission Required

If you're taking this course, it means Comparative Literature is your concentration or your secondary field. Welcome to the discipline! But what does it mean to be a comparatist? This spring, we will wander together through the different paths Comparative Literature offers. This is a course on history and methods. We will trace how the understanding of what it means to compare has changed through time and space. We will examine the

sociopolitical roots of the discipline and think together with the intellectuals who shaped its different stages. To tell the stories of the discipline is, of course, also to inquire into its methods. We will experiment with different analytical modes, and see how they allow us to interact with literary texts. And we will explore theoretical and critical possibilities of both grounding and expanding our readings.

Introduction to German Literature, History, and Thought

2026 Spring (4 Credits)

M 0900 AM - 1145 AM

John T. Hamilton

A survey course on major works in German literature, philosophy, and critique from the mid-eighteenth century to the twentieth century. Close reading of representative texts opens onto broader ramifications in cultural and intellectual history with further consideration of societal and political tensions.

COMPLIT 109X (SEM)**In My Own Words: Self-Translation as Method**

R 0945 AM - 1145 AM

*Ursula Friedman*Course ID: 226261
2025 Fall (4 Credits)

Self-Translation as Method investigates the process, aesthetics, and politics of literary self-translation and transmediation worldwide. Self-translation refers to the process through which authors translate their own writing into another language; such a translation may be undertaken at the same time as the original is composed or long after it is completed, but it always represents a self-reflexive relationship between the author and their own work. Because the self-translator has access to the original's authorial intentions, they are empowered to take creative liberties that a conventional translator might shy away from. Through these creative liberties, self-translators enrich the cultural capital of both their native and adopted language and culture. Self-translation, in this way, often involves writing oneself into world literature, creating cosmopolitan palimpsests that reveal, in their dialogue with diverse cultural traditions, the nonlinear forms of modernity. In this course, we will delve into case studies of self-translation from East Asia, East Africa, Latin America, North America, and Italy. We will also investigate the implications of self-transmediation, which occurs when an author adapts their own work into another medium, transporting that work from the page to the stage to the screen, for instance. For the final assignment, students will produce their own work of self-translation or transmediation.

COMPLIT 110X (LEC)**What Is a Novel?**

M 0300 PM - 0500 PM

*David Damrosch*Course ID: 222724
2026 Spring (4 Credits)

The novel has been described as the quintessential literary form of modernity, but do we know what a novel actually is? And is it just a modern form? In this seminar we will look at a range of pathbreaking works that have bent the norms of prose fiction and have opened up new ways of understanding the world, from antiquity to the present. Readings will include selections from *The Odyssey*, *The Tale of Genji*, and *Don Quixote*, together with a range of modern novels, informed by several important statements on the novel, especially by the writers themselves.

FAS Divisional Distribution: Arts and Humanities

COMPLIT 112X (SEM)**Sinophone Sci-Fi: Reparative Co-Futures**

T 0300 PM - 0500 PM

*Ursula Friedman*Course ID: 224602
2025 Fall (4 Credits)

How does modern Sinophone sci-fi reveal the "dark side" of China's rise to power? How does Sinophone speculative fiction and its transmediated afterlives chart a reparative vision in the face of ongoing ecological and political crises? How do memories of past traumas intersect with future catastrophes in short stories and novels by Sinophone creators? How does speculative fiction produced by women and nonbinary creators forge an alternative path for human-AI collaboration? How do queer, transgressive, and non-human desires coalesce into a flora-fauna-AI symbiosis? How does contemporary Sinophone sci-fi advance inclusive futures for queer, crip, rural, neurodiverse, non-Han, and otherwise disenfranchised individuals in the face of ongoing exploitation? How do translators of Chinese-sci-fi employ a reparative praxis to transmediate trauma for global audiences? In this course, we encounter an array of sci-fi and speculative fiction authored by Ken Liu, Cixin Liu, Han Song, Regina Kanyu Wang, Hao Jingfang, Xia Jia, Gu Shi, Wang Nuonuo, and Chu Xidao, alongside selections by Jorge Luis Borges, Adolfo Bioy Casares, Italo Calvino, Octavia Butler, Margaret Atwood, Ursula K. LeGuin, Ray Bradbury, and Isaac Asimov (reading selections subject to change). We will also examine multimedia adaptations of contemporary Chinese sci-fi, examining the work's evolution from page to screen to stage. All readings will be available in English and films will be available either dubbed or with English subtitles. By engaging with material through a variety of written, oral, and multimedia responses, you will co-create reparative futures alongside these speculative creators.

COMPLIT 116X (SEM)

Humanity, Technology, and Creation

W 0300 PM - 0545 PM

Maira Weigel

Course ID: 226528
2026 Spring (4 Credits)

In recent years, it has become commonplace to hear that new technologies are threatening humanity—that "we" must struggle to "stay human" in the face of novel threats ranging from autonomous weapons to addictive social media apps and gene editing to generative AI. At the same time, the "AI boom" has raised profound questions about creativity as an essentially human trait and inspired widespread concern about AI impacts on human and nonhuman environments—or all creation. Observers often describe the moral and existential challenges that such innovations present as new and unprecedented. But, in fact the concern is at least several centuries old. Drawing on canonical works of literature, philosophy, and cinema, this course will offer an introduction to the long history of thinking about, and working with, new technologies in the arts and humanities. In addition to close reading and analysis, students will engage in a series of "critical making" projects using historical artifacts housed in Harvard's collections and brand-new generative AI tools developed specifically for us. The final assignment will be a short paper that reflects on one of these creative endeavors and connects it to course themes.

COMPLIT 123X (SEM)

On Stolen Land: Indigenous Latin America in 20th and 21st Century Literature

T 0945 AM - 1145 AM

Matylda Figlerowicz

Course ID: 226258
2025 Fall (4 Credits)

This course looks at contemporary Indigenous Latin America through literature. It focuses primarily on texts written by Indigenous authors in different genres and languages; and it includes some texts depicting Indigenous peoples from other vantage points, whether it's in attempts to build solidarity or to revisit historical accounts of national formation—we will ask to what effect. We will analyze the texts' genre structures and aesthetic devices, as well as situate them in a broader set of literary conversations and traditions. Throughout the course, we will discuss the political stakes of the literary texts we read. We will see the works operate in many ways: for instance, they may build power and resistance, bear witness to the brutalization of Indigenous peoples, or uphold narratives of Indigenous erasure. Land is constantly present in the texts as a position of enunciation, a site of struggle, and a topic of reflection. And so, we will ask: what does it mean to write on stolen land?

FAS Divisional Distribution: Arts and Humanities

COMPLIT 145 (SEM)

Prize-Winning Translations, 2010-2020

F 1200 PM - 0245 PM

Luke Leafgren

Course ID: 222886
2026 Spring (4 Credits)

In this course, students will read English translations of novels that have won major prizes. In addition to exploring themes of contemporary literature from around the world, special attention will be paid to the role of translation in shaping the work and its reception, and to the question of what makes for a prize-winning translation. Each week students will read a prize-winning translation alongside reports from the prize committee, reviews of the translation, and what the translators say about their work. Assignments: Write a 2000-word analysis of the translation decisions in a novel translation, with reference to the source text and to the translator's stated goals, if available. Write a 1000-word book review of a translated novel, including a discussion of the translation. Imagine that you are one the committee for one of the prize-winning novels we have read. Write a 2000-word argument for one of the short-listed titles to be chosen in its place. This course satisfies the Arts & Humanities distribution requirement, counts towards the Secondary in Translation Studies, and may be taken pass/fail upon application. Reading knowledge of one language in addition to English is required.

COMPLIT 153X (SEM)

The Cinema of Stanley Kubrick

T 0600 PM - 0800 PM

Justin Weir

Course ID: 226452
2026 Spring (4 Credits)

This course reviews the influential major films of Stanley Kubrick—*Paths of Glory* (1957), *Lolita* (1962), *Dr. Strangelove* (1964), *2001: A Space Odyssey* (1968), *A Clockwork Orange* (1971), *Barry Lyndon* (1975), *The Shining* (1980), *Full Metal Jacket* (1987), and *Eyes Wide Shut* (1999), among other earlier films and his unfinished project *A.I. Artificial Intelligence* (dir. Spielberg 2001). The films will be considered in their historical, cultural, and film studies contexts. Topics include Cold War politics, literary adaptation, the depiction of violence on screen, and the relationship between popular culture and scholarship. We will pay special attention to Kubrick's interest in war, science fiction, and technology, including artificial intelligence. 35mm screenings of the films will be held at the Harvard Film Archive as part of this course. No prerequisites.

COMPLIT 156 (LEC)

Songmaking and the Idea of Lyric

M 0300 PM - 0500 PM

Gregory Nagy

Course ID: 212724
2026 Spring (4 Credits)

A re-examination of "Lyric" as occasion as well as genre. Central questions to be explored will include: how do the "lyrics" of composed song come alive in performance? For example, how do the two librettists of Puccini's opera *La Bohème* contribute to the making of a masterpiece in song? Shared readings include *The Lyric Theory Reader: A Critical Anthology*, edited by Virginia Jackson and Yopie Prins. Students are free to select as their focus of research any particular "lyric" traditions, composed in whatever language. No previous knowledge of literary theory is presumed.

COMPLIT 157 (SEM)

From Type to Self in the Middle Ages

W 1200 PM - 0245 PM

Luis Giron Negron

Course ID: 112654
2026 Spring (4 Credits)

It has been argued that the poetic "I" in premodern literatures is not a vehicle for self-representation, but an archetype of the human. The course will examine this thesis against the rise of autobiographical writing in medieval and early modern Europe. Readings include spiritual autobiographies (Augustine, Kempe, Teresa of Ávila), letter collections (Abelard and Heloise), Arabic and Hebrew *maqama* literature, Provençal troubadour lyric, Hispano-Jewish poetry (Samuel ha-Nagid, Judah Halevi, Solomon ibn Gabirol), prison poetry (Jacopone da Todi, al-Mutamid of Seville, François Villon), pilgrimage narratives, travel literature, Petrarch, Dante (*Vita nuova* and selections of the *Commedia*), Ibn Ḥazm of Córdoba, Latin American chronicles, and the picaresque novel (*Lazarillo de Tormes*). Theoretical perspectives by Spitzer, Lejeune, Zumthor, and DeCerteau.

Course Note: This course counts for the Romance Studies track in the Department of Romance Languages and Literatures.

FAS Divisional Distribution: Arts and Humanities

COMPLIT 166X (SEM)

Calvino and Computation

F 0945 AM - 1145 AM

Jeffrey Schnapp

Using as its point of departure Italo Calvino's essay *Cybernetics and Ghosts*, the course explores combinatorial and computational approaches to creative practice in the context of Surrealism, Oulipo, and the Programmed Art movement of the 1960s and 1970s. The central focus will be on Calvino's own experiments from *The Castle of Crossed Destinies* (1969) to *Invisible Cities* (1972), but readings will also include selections from the Italian Structuralist canon like Umberto Eco's *The Absent Structure* (1968) and from proximate authors such as Gianni Rodari and Bruno Munari.

Course ID: 226338
2026 Spring (4 Credits)

COMPLIT 183 (SEM)

Global Media

MW 1030 AM - 1145 AM

Moirá Weigel

In this course we will examine how media and communication technologies both drive and depict the complex set of processes known as globalization. We will explore case studies from sixteenth century maps to twenty-first century supply chains, as well as Huallywood, Hollywood, Bollywood, and Nollywood films. In the process, we will grapple with major questions and tensions that have defined the modern era. Why have human societies become more closely connected over the past few centuries than at any prior time in human history? How has this interdependence changed the ways that we understand ourselves and one another? What new visions and freedoms has it created? Why has it made us more unequal than ever before? By the end of the semester, students will have gained skills necessary for analyzing media that are produced and consumed across national and linguistic borders. You will have earned familiarity with a number of key analytical and historical categories that will prepare you for advanced coursework in the humanities and social sciences. And you will have applied and developed course concepts and skills through both creative and critical projects. Above all, you will have learned new ways of thinking. Today, when the words on this page can reach you after traveling, as data packets, through undersea cables or outer space satellites, all media are global. At the same time, increasingly ubiquitous networked computation has turned almost everything on earth into a medium of data. Throughout this course, we will seek to unsettle what we think we know about who, and where, we are—gaining insights into how our lives connect to others, past and present, near and far.

COMPLIT 190X (SEM)

Translation and the Craft of Reading Carefully: A World Literature

Introduction

TR 0130 PM - 0245 PM

Spencer Lee-Lenfield

We read a range of historically important works of literature from around the world—twice! We read everything carefully in more than one translation to learn the art of rereading, as well as how to enjoy and critique translations, not just read "through" them. We also learn about the structure of a range of languages, and think about how those languages shape their literatures. This is a great class to take if you're thinking about learning a new language in the future. It's also a good entryway to other literature and language classes for first- and second-year students, as well as for students concentrating in fields outside the humanities. Through a sequence of assignments in analyzing what translations do, we hone your writing for clarity, economy, and logic. This course also counts toward the Secondary Field in Translation Studies. Taught in English; no other languages required (just curiosity).

Course ID: 226431
2026 Spring (4 Credits)

COMPLIT 193 (SEM)

What's Love Got to Do With It; Love Poetry of the Middle Ages and Early Modernity

W 0900 AM - 1145 AM

Course ID: 108791
2025 Fall (4 Credits)

Does love have a history? This course will explore a particularly rich, multiseular episode in the literary history of this emotion: the efflorescence and varieties of love poetry, both lyrical and narrative, in Europe and the Middle East from the Middle Ages through the 16th century. Weekly discussions will center on close readings of selected love poems and versified narratives from a variety of literary traditions, including: Provençal troubadour lyric; French chansons, the Germanic Minnesang and the Galician-Portuguese cantigas (the question of amour courtois); Ibero-Romance and colloquial Arabic jarchas; the Italian dolce stil novo; the Petrarchan sonnet and its early modern heirs in Portugal, England and Spain; Arabo-Andalusian and Hispano-Jewish qasā'id and muwashshahāt, medieval Latin love lyric; Persian Sufi and Christian mystical love poetry; Dante's Vita nuova; and selections from two other erotological classics in narrative verse, Libro de buen amor and Roman de la Rose. Discussions will be framed by an overview of both premodern discussions on love – how love is conceptualized at the intersection of philosophy, theology and medicine by Jewish, Christian and Muslim thinkers– and contemporary scholarly debates on the origins and development of medieval love literature.

Course Note: Offered jointly with the Divinity School as 3725.

Theorizing Digital Capitalism

R 0300 PM - 0545 PM

Moirá Weigel

Course ID: 224734

2025 Fall (4 Credits)

Instructor Permission Required

Since at least the nineteenth century, computation and capitalism have co-evolved with each other. In many respects, computers have served the interests of capital, by creating new modes of accumulation and means of automating, managing, and outsourcing labor, as well as new tools for researching, advertising to, and transacting with customers. However, computers have also been described as fundamentally changing or even overcoming capitalism—both for better and for worse. Theorists have credited computers with eliminating work or turning it into play and transforming market exchanges into gift exchanges. Contemporary platforms and artificial intelligence inspire dreams of "fully automated luxury communism" and fears that law and contracts are being replaced by code and neo-colonial or neo-feudal forms of coercion. In this seminar, we will engage with an outpouring of recent scholarship that attempts to describe and theorize digital capitalism and culture, pairing recent texts with excerpts from canonical works that their authors cite and build upon. In the process, students

will gain exposure to key concepts, debates, and methods in the emerging field(s) of critical data studies, new media studies, and platform studies. We will also reflect upon the nature and purpose of theorizing. A series of assignments and workshops over the course of the semester will guide students through the process of identifying a promising research topic, reviewing scholarly literature, articulating an original research question, and writing a review essay or research paper.

COMPLIT 221X (SEM)

I Forget: Memory Studies and Cold War Literature

W 0300 PM - 0500 PM

Matylda Figlerowicz

Remembering and forgetting, evoking and overlooking: they are parts of our everyday life, as well as practices that cement cultures, traditions, and our ideas of self. This course explores the connections between literature and memory. It looks at a period of particular global conflict over memory, when after the end of World War II, the world moves into the decades of the Cold War. We ask how literature participates in the construction of memory and how it sheds light on different sorts of vulnerability and abuses of memory. In what different roles does literature put us as readers in order to compel us to keep memory alive, participate in its construction, or be tempted into forgetfulness? Through literary and theoretical texts, we will discuss the role of literature in narrating tragic and overwhelming experiences, which hardly find their place in language. We will look at the ways in which past and its evocation can be--deliberately or not--distorted, censored, and used for political aims. And we will reflect on everyday practices of trying to keep memory alive, or trying to forget.

Pioneers of Desolation: Eileen Chang and Katherine Mansfield

R 0945 AM - 1145 AM

Ursula Friedman

Eileen Chang (1920-1995), dubbed "the Greta Garbo of modern Chinese letters" and "the pioneer of desolation",

Course ID: 226272
2026 Spring (4 Credits)

is known for her acerbic psychological forays into her characters' inner turmoil during times of war and upheaval. This course pairs Chang with the New Zealand writer Katherine Mansfield (1888-1923), known for her strikingly modernist short stories and poems delving into her characters' inner psychology. Though the two never met in person, Chang had likely encountered Mansfield's works through a translation rendered by Xu Zhimo (1897-1931). Both authors describe natural images with poetic lyricism, internalize conflict, employ symbolic motifs to externalize emotion, and use writing to dispel personal and national trauma. In this course, we will pair excerpts from Mansfield's *Bliss* and *Other Stories* (1920) and *The Garden Party* and *Other Stories* (1922) with Eileen Chang's *Love in a Fallen City* (1943/2007) and *Lust, Caution* (1979). All readings and discussions will be conducted in English.

Black Classicisms: A Research Seminar and Pedagogy Workshop

W 0300 PM - 0500 PM

Emily Greenwood

This course will examine uses of ancient Greek and Roman Classics in the literatures, arts, and thought of Africa and the Black diaspora. We will analyze how African and black diasporic authors and intellectuals have engaged with, revised, and re-imagined the classics of ancient Greece and Rome, both to expose and critique discourses of racism, imperialism, colonialism, and white supremacy, and as a rich source of radical self-expression. At the same time, we will study the emergence of scholarship on black classicisms in the last thirty years and the theoretical underpinnings of this field. The course is offered as a research seminar with an incorporated pedagogy workshop: one of the coursework assignments is to develop a syllabus for a course on an aspect of Black classicisms that you might teach in the future and seminar discussions will involve short segments on pedagogy. The syllabus is arranged thematically, taking in uses of Classics in literature, art, journalism, and politics. Writers, artists, and politicians whose work and ideas we will study include Phillis Wheatley, William Sanders Scarborough, Anna Julia Cooper, Mary Church Terrell, W.E.B. Du Bois, Romare Bearden, Gwendolyn Brooks, Ralph Ellison, Toni Morrison, Rita Dove, Hastings Kamuzu Banda, Ola Rotimi, Athol Fugard, John Kani, and Winston Ntshona, Wole Soyinka, C.L.R. James, Eric Williams, Aimé Césaire, Derek Walcott, Kamau Brathwaite, Austin Clarke, Marlene NourbaSe Philip, Dionne Brand, and Edwidge Danticat. In addition to works by individual authors we will also consider the circulation of Greek and Roman classical myths, history, and thought in vernacular cultures. Throughout, we will be attentive to the relationship between national contexts and transnational histories and networks, and the phenomenon of classical appropriation in invented modern traditions.

On Imagination: From Plato to postmodernism

W 0945 AM - 1145 AM

Panagiotis Roilos

This seminar explores the development of the concept of imagination in diverse premodern and modern philosophical/theoretical and literary contexts. Emphasis will be placed on Plato, Aristotle, the Neoplatonic philosophers, medieval Christian readers of antiquity, Kant, Fichte, the Romantics, Lacan, Iser, Todorov, and Castoriadis. This seminar will also develop an interdisciplinary approach to the topic by drawing on cognitive sciences and cognitive anthropology.

Hyperreality

W 0945 AM - 1145 AM

Panagiotis Roilos

The crisis of representation in postmodernity—closely connected with social and existential alienation and technological development—often manifests itself in terms of "hyperreality," where any distinction between "the real" and "the simulacrum" is blurred. The boundaries between "reality" and "non-reality" and relevant concepts (e.g. originality, authenticity, mimesis, simulacrum) have been explored and challenged from different but comparable perspectives in philosophy, art, and literature since classical antiquity. This seminar will investigate discourses on, or inspired by "hyperreality" and its epistemological, ontological, and political implications, from

antiquity to postmodernity. Authors and thinkers to be discussed include Plato, Descartes, Schopenhauer, Jean Baudrillard, Guy Debord, Gilles Deleuze, Félix Guattari, Umberto Eco, Fredric Jameson, Paul Virilio, Bruno Latour, Elizabeth Grosz, Niklas Bostrom, Lucian, Pedro Calderón de la Barca, Franz Kafka, Jorge Luis Borges, William Gibson, Philip K. Dick, Christine Broke-Rose, Italo Calvino, Don DeLillo, Julian Barnes.

Questions of Theory

F 0900 AM - 1145 AM

Jeffrey Schnapp, John T. Hamilton

Course ID: 226339
2025 Fall (4 Credits)

Instructor Permission Required

The seminar is built around a sequence of fundamental questions regarding the literary disciplines and media studies, their history and epistemology. Discussions are instigated by readings in philology, stylistics, the history of ideas, semiotics, structuralism, psychoanalysis, post-structuralism, film and media theory, genetic criticism, literary sociology, cultural studies, and digital humanities.

Comparative Literature in Theory and Practice

T 0945 AM - 1145 AM

David Damrosch

Course ID: 111650
2026 Spring (4 Credits)

Instructor Permission Required

An introduction to the discipline of comparative literature, looking at major issues in the history and current practice of the discipline as practiced in the USA, with special emphasis on seeing how comparatists enter into ongoing debates concerning theory and method. Several of our faculty will join us for the discussion of their work. Additional readings will include selections from Herder, de Staël, Adorno, Auerbach, de Man, Glissant, Said, Spivak, Apter, Venuti, and Heise.

Course Note: Required of first-year graduate students in Comparative Literature; open to all graduate students interested in the study of literature in transnational and interdisciplinary perspectives.

Course ID: 222875
2025 Fall (4 Credits)

Translation Proseminar: History, Research, Theories, Craft

T 0900 AM - 1145 AM

Spencer Lee-Lenfield

This course has several interrelated but distinct missions. First, we read selected major works from the history of attempts to theorize literary translation. Second, we read an array of contemporary examples of research on the translation of literature. Third, we also speak with a range of visitors about the production, publication, and dissemination of translations. And fourth, students have an option of drafting a research article or undertaking a major translation project. Graduate students from a range of disciplines are welcome; those pursuing the Secondary Field in Translation Studies (for which this class is a capstone requirement) will receive priority. Undergraduates interested in the course should contact me to explain their reasons; seats will be allocated as available.

Great Ideas in Computer Science

TR 1030 AM - 1145 AM

Henry Leitner

An introduction to the most important discoveries and intellectual paradigms in computer science, designed for students with little or no previous background. Explores problem-solving and data analysis using Python, a programming language with a simple syntax and a powerful set of libraries. This course covers basic data types and collections (lists, dictionaries, tuples, and sets), control flow, recursion, supervised machine learning via regression, visualization, information hiding and encapsulation using classes and objects, and introduces the analysis of program performance. Presents an integrated view of computer systems, from switching circuits up through compilers, and examines theoretical and practical limitations related to unsolvable and intractable computational problems. Other topics include the social and ethical dilemmas presented by such issues as software unreliability, algorithmic bias, artificial intelligence, and invasions of privacy.

Course Note: May not be taken for credit after completing Computer Science 50.

2026 Spring (4 Credits)

Discrete Mathematics for Computer Science

MWF 0945 AM - 1100 AM

Rebecca Nesson

Widely applicable mathematical tools for computer science, including topics from logic, set theory, combinatorics, number theory, probability theory, and graph theory. Practice in reasoning formally and proving theorems.

Course Note: Covers material used in Computer Science 1200 (formerly CS 120), Computer Science 1210 (formerly CS 121), and Computer Science 1240 (formerly CS 124). Ordinarily, not to be taken after those courses or after courses such as Applied Mathematics 106, Applied Mathematics 107, Mathematics 101, and Mathematics 153.

FAS Divisional Distribution: Science & Engineering & Applied Science

An introduction to computational thinking, useful concepts in the field of computer science, and the art of computer programming using Python. Significant emphasis is placed on class meetings and learning to use computers to solve complex, real-world problems. Concepts and techniques are introduced as they are needed to help solve the problems confronting us. Students will learn how to go from an ambiguous problem description to a running solution and will leave the class knowing how to instruct computers to do what they want them to do. Prior experience in computer science or computer programming is not necessary.

Requires: Anti-requisite: Cannot be taken for credit if COMPSCI 1090A, COMPSCI 1090B, APCOMP 209A, APCOMP 209B, STAT 109A, or STAT 109B has already been completed.

Quantitative Reasoning with Data: Yes

COMPSCI 50**Introduction to Computer Science**

M 0130 PM - 0415 PM

David J. Malan

Course ID: 152514
2025 Fall (4 Credits)

This is CS50, Harvard University's introduction to the intellectual enterprises of computer science and the art of programming, for concentrators and non-concentrators alike, with or without prior programming experience. (More than half of CS50 students have never taken CS before!) This course teaches you how to solve problems, both with and without code, with an emphasis on correctness, design, and style. Topics include computational thinking, abstraction, algorithms, data structures, and computer science more generally. Problem sets inspired by the arts, humanities, social sciences, and sciences. More than teach you how to program in one language, this course teaches you how to program fundamentally and how to teach yourself new languages ultimately. The course starts with a traditional but omnipresent language called C that underlies today's newer languages, via which you'll learn not only about functions, variables, conditionals, loops, and more, but also about how computers themselves work underneath the hood, memory and all. The course then transitions to Python, a higher-level language that you'll understand all the more because of C. Toward term's end, the course introduces SQL, via which you can store data in databases, along with HTML, CSS, and JavaScript, via which you can create web and mobile apps alike. Course culminates in a final project. See <https://cs50.harvard.edu/college> for advice, FAQs, syllabus, and what's new. Email the course's heads at heads@cs50.harvard.edu with questions.

Course Note: This course ordinarily meets for lectures in Sanders Theatre on Mondays, 1:30pm–4:15pm, but the course's first lecture will be in Sanders Theatre on Wednesday, September 3, 1:30pm–4:15pm. Students are expected to attend the course's lectures in person unless simultaneously enrolled in another course that meets at the same or an overlapping time, in which case they may watch CS50's lectures online and attend the other course in person. (The Ad Board has already granted this exception for CS50; no other steps are required.) If you have other academic or athletic conflicts, submit cs50.harvard.edu/simultaneous. Course also includes a weekly discussion section, to be arranged. CS50 is ordinarily graded SAT/UNS, though students whose concentration requires letter grades should change their grading status to letter-graded by the term's eleventh Monday. Students may take CS50 SAT/UNS to fulfill the Science and Engineering and Applied Science distribution requirement or the Quantitative Reasoning with Data requirement, but not both. First years may take both CS50 and a first-year seminar SAT/UNS. Graduate students are welcome to enroll in or cross-register for CS50.

David J. Malan, Yuliia Zhukovets

This is CS50, Harvard University's introduction to the intellectual enterprises of computer science and the art of programming, for concentrators and non-concentrators alike, with or without prior programming experience. (More than half of CS50 students have never taken CS before!) This course teaches you how to solve problems, both with and without code, with an emphasis on correctness, design, and style. Topics include computational thinking, abstraction, algorithms, data structures, and computer science more generally. Problem sets inspired by the arts, humanities, social sciences, and sciences. More than teach you how to program in one language, this course teaches you how to program fundamentally and how to teach yourself new languages ultimately. The course starts with a traditional but omnipresent language called C that underlies today's newer languages, via which you'll learn not only about functions, variables, conditionals, loops, and more, but also about how computers themselves work underneath the hood, memory and all. The course then transitions to Python, a higher-level language that you'll understand all the more because of C. Toward term's end, the course introduces SQL, via which you can store data in databases, along with HTML, CSS, and JavaScript, via which you can create web and mobile apps alike. Course culminates in a final project. See <https://cs50.harvard.edu/college> for advice, FAQs, syllabus, and what's new. Email the course's heads at heads@cs50.harvard.edu with questions.

Course Note: This spring version of CS50 is for students who were unable to take the course in Fall. All students, including concentrators and non-concentrators, are encouraged to take CS50 in fall term instead. See <https://cs50.harvard.edu/spring> for differences between fall term and spring term. CS50 is ordinarily graded SAT/UNS, though students whose concentration requires letter grades should change their grading status to letter-graded by the term's eleventh Monday. Students may take CS50 SAT/UNS to fulfill the Science and Engineering and Applied Science distribution requirement or the Quantitative Reasoning with Data requirement, but not both. First years may take both CS50 and a first-year seminar SAT/UNS. Graduate students are welcome to enroll in or cross-register for CS50.

Abstraction and Design in Computation

2026 Spring (4 Credits)

TR 1245 PM - 0200 PM

Stuart Shieber

Fundamental concepts in the design of computer programs, emphasizing the crucial role of abstraction. The goal of the course is to give students insight into the difference between programming and programming well. To emphasize the differing approaches to expressing programming solutions, you will learn to program in a variety of paradigms -- including functional, imperative, and object-oriented. Important ideas from software engineering and models of computation will inform these different views of programming.

Design of Useful and Usable Interactive Systems

MW 0945 AM - 1100 AM

Krzysztof Gajos

Course ID: 123971

2025 Fall (4 Credits)

Instructor Permission Required

Formerly CS 179, the course covers skills and techniques necessary to design innovative interactive products that are useful, usable and that address important needs of people other than yourself. You will learn how to uncover needs that your customers cannot even articulate. You will also learn a range of design principles, effective creativity-related practices, and techniques for rapidly creating and evaluating product prototypes. You will also have several opportunities to formally communicate your design ideas to a variety of audiences. You will complete two large team-based design projects.

Course Note: CS 79 was formerly offered as CS 179. Students who took CS 179 may not take CS 79 for credit.

COMPSCI 1050**Privacy and Technology**

TR 1245 PM - 0200 PM

Jim Waldo

What is privacy, and how is it affected by recent developments in technology? This course critically examines popular concepts of privacy and uses a rigorous analysis of technologies to understand the policy and ethical issues at play. Case studies: database anonymity, research ethics, wiretapping, surveillance, and others. Course relies on some technical material, but is open and accessible to all students, especially those with interest in economics, engineering, political science, computer science, sociology, biology, law, government, philosophy.

Course Note: This course was previously numbered CS 105.

FAS Divisional Distribution: Science & Engineering & Applied Science

Course ID: 125407

2025 Fall (4 Credits)

Instructor Permission Required

COMPSCI 1060**Software Engineering with Generative AI**

TR 0345 PM - 0500 PM

Christopher Thorpe

Software has become a chief driver of innovation in every field of study and industry. Generative AI is rapidly transforming software development—not so much by replacing developers, but rather as a dramatic force multiplier for capable developers. Students will learn and practice industrial software engineering by building Software as a Service (SaaS) with modern tools. These include generative AI, automated testing, continuous integration, and continuous deployment (CI/CD). We will follow a software development lifecycle to plan, design, implement, test, deploy, and maintain a small, cloud-based SaaS system.

Either (a) Two #advancedcs courses with significant programming assignments (COMPSCI 61 counts), or non-Harvard equivalent; or (b) Experience with industrial software engineering (including internships) or completion of a 5,000+ line software project; or (c) SEAS MS/MBA, GSD MDE, and MIT Sloan LGO students may participate in the course without the above prerequisites by completing a pre-course preparation pack.

To enroll in the course, you must explain how you meet the prerequisite requirements in the Permission Request in my.harvard.

Course ID: 226052

2025 Fall (4 Credits)

Instructor Permission Required

COMPSCI 1090A**Data Science 1: Introduction to Data Science**

MW 1030 AM - 1145 AM

Pavlos Protopapas, Kevin A. Rader

Data Science 1 is the first half of a one-year introduction to data science. The course will focus on the analysis of messy, real life data to perform predictions using statistical and machine learning methods. Material covered will integrate the five key facets of an investigation using data: (1) data collection - data wrangling, cleaning, and sampling to get a suitable data set; (2) data management - accessing data quickly and reliably; (3) exploratory

Course ID: 109899

2025 Fall (4 Credits)

data analysis – generating hypotheses and building intuition; (4) prediction or statistical learning; and (5) communication – summarizing results through visualization, stories, and interpretable summaries. Part one of a two part series. The curriculum for this course builds throughout the academic year. Students are strongly encouraged to enroll in both the fall and spring course within the same academic year.

Course Note: Only one of CS 1090a (previously CS 109a), AC 209a, Stat 109a, or Stat 121a can be taken for credit. This course was previously numbered CS 109a.

Programming knowledge at the level of CS 50 or above, and statistics knowledge at the level of Stat 100 or above (Stat 110 recommended).

Requires: Not to be taken in addition to Applied Computation 209, or Applied Computation 209A, or Statistics 109A, or Statistics 121, or Statistics 121A.

Quantitative Reasoning with Data: Yes

Full Year Course: Divisible Course

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 1090B

Course ID: 203546

Data Science 2: Advanced Topics in Data Science

2026 Spring (4 Credits)

MWF 0945 AM - 1100 AM

Pavlos Protopapas, Alex Young

Data Science 2 is the second half of a one-year introduction to data science. Building upon the material in Data Science 1, the course introduces advanced methods for statistical modeling, representation, and prediction. Topics include multiple deep learning architectures such as CNNs, RNNs, transformers, language models, autoencoders, and generative models as well as basic Bayesian methods, and unsupervised learning. Students are strongly encouraged to enroll in both the fall and spring course within the same academic year. Part two of a two-part series.

Course Note: Can only be taken after successful completion of CS 1090a (previously CS 109a), AC 209a, Stat 109a, or Stat 121a, or equivalent. This course was previously numbered CS 109b.

CS 1090a (previously CS 109a), AC 209a, Stat 109a, or Stat 121a required.

Requires: Requisite: (Must take CS 1090A OR APCOMP 209A OR STAT 121A before taking CS 1090B) AND (Not to be taken in addition to APCOMP 209B, OR STAT 121, OR STAT 121B.)

COMPSCI 1200

Course ID: 218613

Introduction to Algorithms and their Limitations

2025 Fall (4 Credits)

TR 0945 AM - 1100 AM

Salil Vadhan

An introductory course in theoretical computer science, aimed at giving students the power of using mathematical abstraction and rigorous proof to understand computation. Thus equipped, students will be able to design and use algorithms that apply to a wide variety of computational problems, with confidence about their correctness and efficiency, as well as recognize when a problem may have no algorithmic solution. At the same time, they will gain an appreciation for the beautiful mathematical theory of computation that is independent of (indeed, predates) the technology on which it is implemented.

Course Note: This course was previously numbered CS 120.

Experience with proofs and discrete mathematics at the level of Computer Science 20, and Python programming at the level of Computer Science 50.

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 1200

Course ID: 218613

Introduction to Algorithms and their Limitations

2026 Spring (4 Credits)

MW 1245 PM - 0200 PM

Anurag Anshu

An introductory course in theoretical computer science, aimed at giving students the power of using

mathematical abstraction and rigorous proof to understand computation. Thus equipped, students will be able to design and use algorithms that apply to a wide variety of computational problems, with confidence about their correctness and efficiency, as well as recognize when a problem may have no algorithmic solution. At the same time, they will gain an appreciation for the beautiful mathematical theory of computation that is independent of (indeed, predates) the technology on which it is implemented.

Course Note: This course was previously numbered CS 120.

Experience with proofs and discrete mathematics at the level of Computer Science 20, and Python programming at the level of Computer Science 50.

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 1210

Course ID: 119064

Introduction to Theoretical Computer Science

2025 Fall (4 Credits)

TR 0345 PM - 0500 PM

Adam Hesterberg

Computation occurs over a variety of substrates including silicon, neurons, DNA, the stock market, bee colonies and many others. In this course we will study the fundamental capabilities and limitations of computation, including the phenomenon of universality and the duality of code and data. Some of the questions we will touch upon include: Are there functions that cannot be computed? Are there true mathematical statements that can't be proven? Are there encryption schemes that can't be broken? Is randomness ever useful for computing? Can we use the quirks of quantum mechanics to speed up computation?

Course Note: This course was previously numbered CS 121.

Experience in formal mathematics at the level of CS 20. See the course Canvas page to link to a "Homework Zero" to complete before the first lecture.

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 1240

Course ID: 115384

Data Structures and Algorithms

2026 Spring (4 Credits)

MW 0215 PM - 0330 PM

Madhu Sudan, Adam Hesterberg

Design and analysis of efficient algorithms and data structures. Algorithm design methods, graph algorithms, approximation algorithms, and randomized algorithms are covered.

Course Note: This course was previously numbered CS 124.

Knowledge of how to write mathematical proofs, such as from Computer Science 20, Applied Math 22, or Math 22, is required; more advanced courses such as Computer Science 1200 (formerly CS 120), Math 23, Math 25, and Math 101 may be helpful but are not required.

Basic programming skills, such as from Computer Science 32 or 50, are required; Computer Science 51 and/or 61 may be helpful but are not required. No specific programming language is required.

Knowledge of discrete math and probability, such as from Computer Science 20 or self-study, is required. Statistics 110 may be helpful but is not required.

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 1261

Course ID: 226548

Privacy, Fairness, and Validity Through the Lens of Theoretical CS

2026 Spring (4 Credits)

MW 1245 PM - 0200 PM

Cynthia Dwork

Imagine you are a developer at -- or regulating, from your position as CTO of the Federal Trade Commission -- a company that capitalizes on large amounts of personal data for use in a wide range of settings, from analyzing markets to advising judges on parole decisions, to selecting candidates to interview, to testing drugs. How might you think about incorporating societal values, such as privacy, fairness, and statistical validity? What mathematical guarantees are achievable, and what is impossible? How does privacy differ from cryptographic secrecy, and which concept is appropriate for which setting? This class will provide an introduction to the theoretical underpinnings of algorithmic fairness, differentially private data analysis, cryptography, and ensuring statistical validity, emphasizing common underlying themes and conceptual breakthroughs.

Course Note: CS 1261 is a CS-only variant of CS 1260, and, unlike that course, is not interwoven with a course in at Harvard Law School. Students who have taken CS 1260 may not take CS 1261.

Requires: Anti-Requisite: Cannot be taken for credit if COMPSCI 1260 already complete.

COMPSCI 1280

Convex Optimization and Applications in Machine Learning

MW 1115 AM - 1230 PM

Yiling Chen

Course ID: 219745
2026 Spring (4 Credits)

Instructor Permission Required

This course focuses on recognizing, formulating, and solving convex optimization problems. We will introduce basic convex analysis, discuss convex optimization theory, introduce algorithms for solving convex optimization problems, and touch on some advanced topics. We will explore all these in the context of machine learning applications as almost every machine learning problem can be formulated as an optimization problem. The objective is to give students the theoretical training to recognize and formulate convex optimization problems and provide students with the tools and methods to solve the problems of interest.

Course Note: Course previously offered as Applied Mathematics 122 and CS 128.

Multivariable calculus (AM 21a or Math 21a), linear algebra (AM 21b or Math 21b/22a/25a/55a or equivalent), Python programming (CS 50, AM 10 or equivalent) and some basic understanding of probabilities. Linear programming (AM 121 or equivalent) or some basic understanding of mathematical optimization is helpful but not required.

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 1360

Economics and Computation

TR 1115 AM - 1230 PM

Ariel Procaccia

Course ID: 128164
2026 Spring (4 Credits)

Instructor Permission Required

The course explores the interaction between the disciplines of economics and computer science. In one direction, we will see how computational thinking (including concepts like approximation algorithms and worst-case analysis) gives a new perspective on areas of economic theory such as game theory, mechanism design, and social choice. In the other direction, we will discuss how economic approaches can address timely questions in computer science and artificial intelligence. Special attention will be devoted to problems of societal significance. For a detailed list of topics, see the course schedule.

Course Note: This course was previously numbered CS 186 and CS 136.

Familiarity with probability theory (as taught by, e.g., Stat 110) and the basics of theoretical computer science (e.g., complexity theory and asymptotic runtime analysis, as taught by CS 1200, 1210, or 1240) is assumed. Background in artificial intelligence, such as CS 1810 or CS 1820, is useful but not required. Background in economic theory is not assumed.

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 1410

Computing Hardware

MW 1245 PM - 0200 PM

Woodward Yang

Course ID: 113856
2025 Fall (4 Credits)

Instructor Permission Required

This course delves into the design principles and practices of high performance digital computing systems that are cost effectively and reliably manufactured with billions of near atomic scale semiconductor components. Key abstractions and foundational concepts are emphasized as the course covers the basic operation of CMOS transistors and logic gates, combinational and sequential logic including Finite State Machines (FSMs), digital memory subsystems, and machine code culminating with the implementation of a MIPS processor. Lab assignments will focus on the practical aspects of digital hardware design by utilizing Field Programmable Gate Arrays (FPGAs), Verilog (Hardware Description Language) and advanced CAD tools for the design, simulation and verification of digital computing hardware.

Course Note: This course was previously numbered CS 141.

CS 50 is strongly advised and will be considered for permission to enroll. ES 50 is also highly recommended.

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 1411

Computer Architecture

F 0900 AM - 1145 AM

David Brooks

Review of the fundamental structures in modern processor design. Topics include computer organization, memory system design, pipelining, and other techniques to exploit parallelism. Discussion of modern topics including GPU architectures, datacenter architecture, mobile/embedded SoC architectures, and machine learning acceleration as time permits. Emphasis on a quantitative evaluation of design alternatives and an understanding of performance and energy consumption issues.

Course Note: This course was previously numbered CS 146.

Requires: Prerequisite: Computer Science 141

FAS Divisional Distribution: Science & Engineering & Applied Science

Course ID: 113270

2026 Spring (4 Credits)

COMPSCI 1430

Computer Networks

MW 0345 PM - 0500 PM

H. Kung

Computer networking has enabled the emergence of mobile and cloud computing, creating two of the most significant technological breakthroughs in computing. Computer networks have become even more critical these days since remote activities have become a new norm. We expect several focuses in the coming years. First, we will witness the emergence of 5G wireless mobile networks, which have already begun to replace the current 4G networks. Second, cybersecurity and privacy will receive unprecedented attention from the industry. Third, blockchain technology, which underlies Bitcoin, creates a new trusted network infrastructure for many new distributed applications. Fourth, distance learning and virtual meetings will push the limits of current multicast and network management technologies. In this course, students will learn basic networking protocols as well as these timely topics.

Course Note: This course was previously numbered CS 143.

CS50 (or programming experience) and a strong interest in the subject matter. Lab sessions will be provided to give extra support.

FAS Divisional Distribution: Science & Engineering & Applied Science

Course ID: 118418

2026 Spring (4 Credits)

Instructor Permission Required

COMPSCI 1480

Design of VLSI Circuits and Systems

MW 0945 AM - 1100 AM

Gage Hills

Presentation of concepts and techniques for the design and fabrication of VLSI systems and digital MOS integrated circuits. Topics include: basic semiconductor theory; MOS transistors and digital MOS circuits design; synchronous machines, clocking, and timing issues; high-level description and modeling of VLSI systems; synthesis and place and route design flows; and testing of VLSI circuits and systems. Various CAD tools for design, simulation, and verification are extensively used.

Course Note: Offered in alternate years. This course was previously numbered CS 148.

Computer Science 1410 (formerly CS 141) or permission of instructor.

Requires: Prerequisite: Computer Science 141

2026 Spring (4 Credits)

Instructor Permission Required

COMPSCI 1520

Programming Languages

TR 1115 AM - 1230 PM

Nada Amin

Comprehensive introduction to the principal features and overall design of both traditional and modern programming languages, including syntax, formal semantics, abstraction mechanisms, modularity, type systems, naming, polymorphism, closures, continuations, and concurrency. Provides the intellectual tools needed to

Course ID: 119629

2026 Spring (4 Credits)

design, evaluate, choose, and use programming languages.

Course Note: This course was previously numbered CS 152.

Computer Science 51; Computer Science 1210 (formerly CS 121) is recommended. Students must have good programming skills, be very comfortable with recursion, proofs, basic mathematical ideas and notations, including sets, relations, functions, and induction.

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 1530

Course ID: 131493

Compilers

2025 Fall (4 Credits)

MW 1245 PM - 0200 PM

Stephen Chong

Implementation of efficient interpreters and compilers for programming languages. Associated algorithms and pragmatic issues. Emphasizes practical applications including those outside of programming languages proper. Also shows relationships to programming-language theory and design. Participants build a working compiler including lexical analysis, parsing, type checking, code generation, and register allocation. Exposure to run-time issues and optimization.

Course Note: This course was previously numbered CS 153.

Computer Science 51 or 61.

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 1610

Course ID: 113847

Operating Systems

2026 Spring (4 Credits)

MW 0215 PM - 0330 PM

James Mickens

This course focuses on the design and implementation of modern operating systems. The course discusses threads, processes, virtual memory, schedulers, and the other fundamental primitives that an OS uses to represent active computations. An exploration of the system call interface explains how applications interact with hardware and other programs which are concurrently executing. Case studies of popular file systems reveal how an OS makes IO efficient and robust in the midst of crashes and unexpected reboots. Students also learn how virtualization allows a physical machine to partition its resources across multiple virtual machines. Class topics are reinforced through a series of intensive programming assignments which use a real operating system.

Course Note: This course was previously numbered CS 161.

Computer Science 61.

COMPSCI 1650

Course ID: 119249

Data Systems

2025 Fall (4 Credits)

TR 0945 AM - 1100 AM

Stratos Idreos

We are in the big data era and data systems sit in the critical path of everything we do. We are going through major transformations in businesses, sciences, as well as everyday life - collecting and analyzing data changes everything and data systems provide the means to store and analyze a massive amount of data. This course is a comprehensive introduction to modern data systems. The primary focus of the course is on the modern trends that are shaping the data management industry right now: column-store and hybrid systems, shared nothing architectures, cache conscious algorithms, hardware/software co-design, main-memory systems, adaptive indexing, stream processing, scientific data management, and key-value stores. We also study the history of data systems, traditional and seminal concepts and ideas such as the relational model, row-store database systems, optimization, indexing, concurrency control, recovery and SQL. In this way, we discuss both how and why data systems evolved over the years, as well as how these concepts apply today and how data systems might evolve in the future. We focus on understanding concepts and trends rather than specific techniques that will soon be outdated - as such the class relies largely on recent research material and on a semi-flipped class model with a lot of hands-on interaction in each class.

Course Note: This course was previously numbered CS 165.

2026 Spring (4 Credits)

Engineering Usable Interactive Systems

MW 0345 PM - 0500 PM

Instructor Permission Required

Elena Glassman

In this course, students learn critical techniques, concepts, and technologies for building usable interactive systems, alone and in pairs. Assignments provide hands-on experiences with different modern frameworks, platforms, and libraries while conceptual commonalities and distinctions are annotated and explained. Lectures cover relevant basic and advanced topics, such as human cognitive capabilities, iterative prototyping, and human-AI interaction. The final project will require both front-end and back-end development, iterative prototyping with humans, and a final evaluation with target users. Designed for advanced undergraduates.

Course Note: This course was previously numbered CS 178.

Programming experience required, i.e., CS 51 and/or CS 61; some experience debugging on one's own with online community resources, and some familiarity with design recommended, e.g., CS 179, or permission of instructor.

Course ID: 110661
2025 Fall (4 Credits)

Planning and Learning Methods in AI

TR 1115 AM - 1230 PM

Stephanie Gil, Kianté Brantley

Artificial Intelligence (AI) is already making a powerful impact on modern technology, and is expected to be even more transformative in the near future. The course introduces the ideas and techniques underlying this exciting field, with the goal of teaching students to identify effective representations and approaches for a wide variety of computational tasks. Topics covered in this course are broadly divided into search and planning, optimization and games, and uncertainty and learning. Special attention is given to ethical considerations in AI and to applications that benefit society. For more information please see the course website.

Course Note: This course was previously numbered CS 182.

Students must have previously taken Statistics 110 (Probability) or an equivalent course. Experience with Python programming, as well as an understanding of the design and analysis of algorithms (including time complexity and big O notation), are assumed.

FAS Divisional Distribution: Science & Engineering & Applied Science

Course ID: 117372
2025 Fall (4 Credits)

Introduction to Computational Linguistics and Natural-language Processing

MWF 1115 AM - 1230 PM

Instructor Permission Required

Stuart Shieber

Natural-language-processing applications are ubiquitous – from digital assistants like Siri or Alexa, to machine translation systems like Google Translate, to fluent conversational systems like ChatGPT, Claude, and Gemini. How do such systems work? This course provides an introduction to the field of computational linguistics, the study of human language using the tools and techniques of computer science, with applications to a variety of natural-language-processing problems such as these. You will work with ideas from linguistics, statistical modeling, machine learning, and neural networks, especially the technologies behind current large language models (LLMs). The course is lab- and project-based, with students working primarily in small teams, and culminates in the building and testing of a full transformer-based question-answering system.

Course Note: This course was previously numbered CS 187.

Programming ability and computer science knowledge at the level of CS51; knowledge of discrete mathematics, including basic probability, statistics, and logic at the level of CS20; some familiarity with Python programming.

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 1960

Course ID: 221939
2026 Spring (4 Credits)

Designing K-12 Computer Science Learning Experiences

W 0900 AM - 1145 AM

Instructor Permission Required

Karen Brennan

From computational thinking to workforce arguments, there is considerable interest in and excitement about including computer science education for all K-12 students. Yet, unlike other disciplines with a much longer history in formal schooling, the interest in computer science education is not yet supported by commensurate attention to research and teacher practice. In this course, we will examine the state of K-12 computing education: questioning its value, examining its history, and imagining and contributing to its potential. The course will be organized as both a reading group and a lab, building a community of people who are committed to K-12 CS education. Each week you will read classic and current research, and write accompanying memos to document your evolving understandings of the field. Throughout the course, either individually or with partners,

you will develop an independent project that explores the design of K-12 computer science learning experiences. Some examples of possible projects include: designing CS-standalone or cross-curricular learning activities and curriculum, building a programming language for novices, developing an annotated bibliography, critically analyzing policy documents such as curriculum frameworks and standards from around the world, or contributing to current K-12 CS education research initiatives.

Course Note: The course enrollment procedure will be posted to the course website. Students who enroll in the course will be expected to engage in a term-long project related to K-12 computer science education. No auditors. This course is also offered as EDU T217 at HGSE. This course was previously numbered CS 196.

Prior (or anticipated) experience with K-12 computer science is encouraged.

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 2050

High Performance Computing for Science and Engineering

TR 0215 PM - 0330 PM

Chuck Witt

As manufacturing processes approach the physical limits of transistor density on modern computing architectures, efficient code must leverage parallel execution to scale with available hardware resources. It is therefore crucial for software developers to adopt a "think parallel" mindset, given that computers are a fundamental tool for solving complex scientific problems across academia, industry, and society. This course introduces parallel programming and its relationship to computer architectures. Various forms of parallelism are considered and exploited through several programming models, with a particular focus on shared and distributed memory programming. The techniques are explored in depth with homework, lab sessions, and a term project.

Course Note: This course was previously numbered CS 205.

The course assumes the student is comfortable reading and writing code in C++ and Python. Familiarity with Linux command line tools, particularly ssh and Git, is also expected. While advanced C++ knowledge is not required, CS2050 will not teach the basics of programming, and the class is likely unsuitable for first-year students. A determined student who lacks one or two of these prerequisites might still manage to succeed in the course, but only if they are willing to work hard and use external resources to fill gaps in their knowledge.

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 2212

Biology and Complexity

TR 1245 PM - 0200 PM

Leslie Valiant

Many processes in biology consist of step-by-step processes, whether in evolution, neural activity, development, or protein circuits. In many of these processes the actual steps taken by biological systems are not currently understood. Further, even the outcomes that are being realized by these processes are not well understood. In general, current understanding of most aspects of biology is not complete or specific enough to provide theories in which predictions can be made by analysis or computer simulation. Computer science is the study of step-by-step processes and of specifications of the outcomes that such processes can realize. For many computational outcome specifications, it is known or believed that no mechanism with feasible resources can realize them. Computer science therefore offers a top-down approach to understanding what could possibly be computed in biology, and how. In this course we shall pursue this computational complexity approach, whose origins go back to Turing and von Neumann. Emphasis will be on evolution and neuroscience, but other topics such as development will be also discussed. Research papers that address some aspect of the complexity question, whether by mathematical analysis, computer simulations or experimental findings will be discussed.

Course Note: This course was formerly offered as CS 229R in Spring 2023.

CS 1210 (formerly CS 121)/CS 1240 (formerly CS 124) or equivalents.

COMPSCI 2232

Quantum Complexity Theory

TR 1030 AM - 1145 AM

Anurag Anshu

This course will offer an introduction to cutting-edge ideas in quantum complexity theory, with the goal of

Course ID: 226736

2025 Fall (4 Credits)

preparing students to pursue research in the field. Quantum non-local games and quantum many-body systems will be the central focus of discussions. We will cover ideas such as tests of quantumness, multi-prover quantum interactive proofs, area laws in local Hamiltonians and quantum PCP conjecture. Tests of entanglement, from multiprover as well as many-body point of view, will be the key takeaways.

A quantum algorithms or quantum information course at the level of CS 2310, and a undergraduate level computer science course at the level of CS 1200/ CS 1240.

COMPSCI 2233

Quantum Learning Theory

MW 0300 PM - 0415 PM

Sitan Chen, Jordan Cotler

How can we use quantum computation to learn properties of quantum systems? Answering this question helps us understand the power of quantum computers in assisting experimental physicists with studying quantum materials, while also providing valuable tools for quantum ML to develop algorithms based on quantum data. Quantum learning theory has become a core subject in quantum information and computation, and this course is one of the first to present the subject in its entirety. Topics include the theory of learning quantum states and dynamics, the role of quantum memory, random and pseudorandom quantum circuits, and learning quantum many-body systems.

Course Note: CS 2233 is also offered as Physics 272. Students may not take both for credit.

Stat 110 and familiarity with quantum mechanics / quantum computing at the level of Physics 143A (quantum mechanics I) or Physics 160 (quantum information) is very strongly recommended.

2025 Fall (4 Credits)

statistical analysis of large datasets. Differential privacy provides a concrete measure of privacy loss, and differentially private algorithms are equipped with a parameter for controlling this loss. A signal property of differential privacy is closure under composition, meaning that we can understand and control the cumulative privacy loss as the data are subjected to multiple analyses. In consequence, differential privacy is programmable: one can combine simple differentially private computational primitives in creative ways to obtain privacy-preserving algorithms for complex analytical tasks. The course will cover (1) the basics of differential privacy: the definition and its properties, computational primitives, and composition theorems; (2) selected advanced differentially private algorithms drawn from the literature and a wide range of application areas from industry to the US Census; and (3) applications of differential privacy to validity and replicability of data analyses.

Course Note: This course was previously numbered CS 226R.

At least one of CS 1210, CS 1240, CS 1260, and CS 2080 (formerly CS 121, CS 124, CS 126, and CS 208).

Optimized Democracy

2025 Fall (4 Credits)

MW 1115 AM - 1230 PM

Instructor Permission Required

Ariel Procaccia

The course examines the mathematical and algorithmic foundations of democracy, running the gamut from theory to applications. The goal is to provide students with a rigorous perspective on, and a technical toolbox for, the design of better democratic systems. Topics include computational social choice (identifying optimal voting rules), fairness in political redistricting (avoiding gerrymandering) and apportionment (allocating seats on a representative body), sortition (randomly selecting citizens assemblies), liquid democracy (transitively delegating votes), and weighted voting games (analyzing legislative power through cooperative game theory).

Course Note: This course was previously numbered CS 238.

Students should have a basic understanding of probability theory and algorithms. Examples of concepts that are useful to know include Markov chains, concentration inequalities, NP-hardness and linear programming. Mathematical maturity (following proof sketches in real time) is expected. Although this is primarily a graduate course, undergraduate students who have previously taken Statistics 110 and CS 1240 (formerly CS 124) are very welcome.

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 2420

Course ID: 160624

Computing at Scale

2025 Fall (4 Credits)

MW 0345 PM - 0500 PM

H. Kung

This course focuses on efficient AI computations aimed at reducing the cost of AI model training and inference. Students will learn systematic methods for implementing parallel and distributed computations for computer vision and language models such as CNNs and Transformers across multiple computing cores or nodes. They will also learn techniques for co-designing machine learning models, data curation methods, computing algorithms, and system architectures. Techniques to be studied include systolic arrays, low-bitwidth arithmetic, model pruning, quantization, distillation, low-rank fine-tuning, dynamic selection of submodels (e.g., experts) based on input, speculative decoding, synthetic data generation with stable diffusion, data and model security, scheduling for efficient memory access, reasoning with reinforcement learning, and test-time computing for

reasoning. As a part of programming assignments, students will utilize large language models to generate code that can leverage AI accelerating techniques learned in this course. Upon successful completion of this course, students will be equipped to address the challenging tasks of designing and utilizing energy-efficient, high-performance AI accelerators.

Course Note: This course was previously numbered CS 242.

Recommended prerequisites include: (1) programming experience (Python, MatLab or C/C++ should be fine); (2) basic knowledge in systems and machine organization; (3) familiarity in data structures and algorithms; and (4) maturity in mathematics (e.g., being able to make use of undergraduate linear algebra and statistics). For students with strong interest in the subject matter and related research experience, one of these four requirements may be waived. Labs and extra support will provide preparation in the first weeks of the semester to help students quickly obtain parts of the background necessary to excel in the course.

Conceptualizing, Building, and Evaluating Usable Novel Interactive Systems

Course ID: 224543
2026 Spring (4 Credits)

MW 0345 PM - 0500 PM

Instructor Permission Required

Elena Glassman

Students learn critical techniques, concepts, and technologies for building usable novel interactive systems, alone and in teams. Assignments provide hands-on experiences with different modern frameworks, platforms, and libraries while conceptual commonalities and distinctions are annotated and explained at multiple levels, from the programming environments to the interfaces users interact with. Discussions grounded in readings will also cover human cognitive capabilities, iterative prototyping, and human-AI interaction. The final research project requires iteratively designing and building a novel interactive system informed by pilot user studies and a final evaluation with target users. Designed for PhD students interested in HCI or using interactive systems as tools for discovery in other fields.

Programming experience required; undergraduate prerequisite: CS 2790R (formerly CS 279R).

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 2790R
Research Topics in Human-Computer Interaction

Course ID: 121985
2025 Fall (4 Credits)

MW 0130 PM - 0245 PM

Instructor Permission Required

Elena Glassman

Students will read, write about, prepare presentations about, and discuss human-computer interaction (HCI) and HCI-relevant work with a focus on papers about interfaces and automation that work especially well with (or clash against) human cognitive capabilities. Papers will primarily be on the building and evaluation of novel systems, as well as theories of and studies characterizing human cognition relevant to human-AI interaction scenarios. As a semester-long final project, students will pursue a research project of their own design in self-organized groups and present their findings in writing and orally in a conference-style format, as means to understand more deeply the processes behind HCI research.

Course Note: Designed for PhD students from all areas; a diversity of disciplinary backgrounds has greatly benefited past student teams. Several student teams have subsequently iterated on and published their projects in top-tier venues. Masters students and advanced undergraduates are welcome, particularly those who wish to write a thesis or apply for a PhD in an area related to Human-Computer Interaction. This course was previously numbered CS 279R.

Undergraduates are strongly recommended to have taken at least one of these related Computer Science classes first: 1710/171, 179, 1780/178, 79, 73, or 2760/276. Exceptions may be made in light of prior relevant research experiences.

COMPSCI 2822R
Topics in Machine Learning: Computational Properties in Interpretable Machine Learning

Course ID: 156936
2026 Spring (4 Credits)

MW 1245 PM - 0200 PM

Instructor Permission Required

Finale Doshi-Velez

There has been growing interest in recent years for machine learning systems that are somehow transparent about their inner workings -- whether it be that the entire system is inherently interpretable, or that a single decision can somehow be explained. However, the question of what approach is best for what context remains elusive. In this course, we will focus on computational properties of interpretable machine learning methods,

such as faithfulness or stability. Assessing methods with respect to these properties may allow us to rule out poorly-performing approaches without the need for expensive user studies. By categorizing methods by their computational properties, we will also be able to start thinking about which methods might be useful for a specific context. After a few initial assignments, the course will be focused on reading papers, discussion, and a semester-long project.

Course Note: This course was previously numbered CS 282R.

Students are expected to be fluent in basic linear algebra (matrix manipulation), basic statistics (e.g. rules of expectations, importance sampling), basic reinforcement learning (at a CS181/181 level), and basic software engineering (e.g. programming in Python and numpy, data with 10,000+ rows).

Computational Optimal Transport for Machine Learning

2025 Fall (4 Credits)

TR 1245 PM - 0200 PM

Instructor Permission Required

David Alvarez Melis

Optimal Transport (OT) has quickly become an important part of the Machine Learning (ML) toolkit, where it has been used for various purposes, from learning mappings between datasets to proving convergence results for neural network training. This advanced-topics course will cover the mathematical foundations and computational aspects of OT in the context of machine learning applications. Foundational topics covered will include: Monge and Kantorovich formulations of OT, duality, entropy regularization, Gromov-Wasserstein distances, dynamic formulations, and Benamou-Brenier theory. Each of these will be presented in the context of their use for specific problems in machine learning, including domain adaptation, generative models, correspondence analysis, and gradient flows. The course combines theoretical rigor with practical exercises, implementing OT algorithms and analyzing their impact on real-world machine learning challenges. The classes will consist of a combination of instructor-led lectures on fundamentals and student-led discussion of relevant academic papers. Interested students should have a solid foundation in linear algebra, probability, and machine learning principles.

Mathematical maturity and familiarity with machine learning (e.g. via CS 181), optimization (e.g. APMATH 121), and probability (e.g., STAT 110) are strongly encouraged.

AI for Social Impact

2026 Spring (4 Credits)

MW 0215 PM - 0330 PM

Instructor Permission Required

Milind Tambe

Recent years have seen AI successfully applied to societal challenge problems. Indeed, recognizing the potential of AI for tremendous social impact in the future, "AI for social impact" is growing as a subdiscipline within AI. In this course, we will discuss successful case studies of use of AI for public health, environmental sustainability, public safety and public welfare. Simultaneously, we will discuss key foundations of the area of AI for social impact. To that end, among other topics, we will focus on challenges in AI for Social Impact, what makes projects successful, how to investigate project impact in the field and ethical considerations for such projects. A key part of this course will be AI4SI projects with non-profits.

Course Note: This course was previously numbered CS 288.

Students must have adequate background in AI, such as CS 1810 (formerly CS 181) or 1820 (formerly CS 182) or equivalent introductory courses. Students who have previous experience in AI for social impact, e.g., interdisciplinary projects that considered direct societal applications, will be given priority.

FAS Divisional Distribution: Science & Engineering & Applied Science

COMPSCI 2881R

Topics in Foundations of ML: AI Alignment and Safety

2025 Fall (4 Credits)

R 0345 PM - 0630 PM

Instructor Permission Required

Boaz Barak

This will be a graduate level course on challenges in alignment and safety of artificial intelligence. We will consider both technical aspects as well as questions on societal and other impact on the field. This is a fast-moving area and it will be a fast-moving course. I will expect students to be able to pick up technical

knowledge on their own. In a sense, the programming language for this course will be English: students will be allowed and encouraged to use AI tools for all homework and assignments. On the other hand, this means that expectations will be raised: it may well be the case that I would expect you to do in a week assignments that in previous years would have taken a month.

Course Note: This course was previously numbered CS 229BR. Enrollment priority is given to PhD students. If you are interested in taking this course, please fill out the form <https://forms.gle/Xd1HgTcZkmE95XaZ8> to make sure you get updates on homework zero and other course logistics.

Students are expected to be proficient in programming as well as mathematically mature. You should be comfortable with concepts in statistics, optimizations, as well as programming and applied machine learning such as training and fine tuning a neural network. In particular we expect students to be familiar with all concepts taught at Harvard CS 1810 (formerly CS 181) or MIT 6.390. Most of all, you should be prepared to pick up both applied skills and mathematical topics on your own. I will publish a "Homework Zero" on my homepage before the course starts. Students will be required to complete and submit it in order to apply to be enrolled in the course.

COMPSCI 2901

Course ID: 216811
2025 Fall (2 Credits)

Seminar on Effective Research Practices and Academic Culture

F 0945 AM - 1145 AM

Boaz Barak

This is a reading and discussion-based seminar designed for entering Computer Science Ph.D. students. This course prepares students to manage the difficult and often undiscussed challenges of Ph.D. programs through sessions on research skill building (e.g. paper reading, communication), soft skill building (e.g. managing advising relationships, supporting your peers), and academic culture (e.g. mental health in academia, power dynamics in scientific communities), as well as research and professional-oriented discussions. This is a full-year, 4-unit course, meeting once a week in each of the fall and the spring. Students must complete both terms of this course (CS 2901 and CS 2902) within the same academic year to receive credit.

Course Note: This course is required for new (G1) Computer Science Ph.D. students. It satisfies one of the CS 200-level electives (one of the 10 required classes for the Computer Science Ph.D. degree). SEAS G1 Ph.D. students in related fields may petition to enroll with instructor permission. This course was previously numbered CS 290A.

Requires: Graduate Year 1 Comp-Sci PhDs Only

Full Year Course: Indivisible Course

E-PSCI 6

Course ID: 216015
2025 Fall (4 Credits)

Introduction to Environmental Science and Engineering

MW 1030 AM - 1145 AM

Steven Wofsy, Bryan Yoon

This course will provide students with an introduction to environmental science and engineering by providing an overview of current environmental issues, including climate change, air pollution, and water pollution. Students critically evaluate underlying science and knowledge limitations, and explore the nexus between scientific knowledge, regulatory frameworks, and engineering solutions to some of the world's most pressing environmental problems. The course will emphasize the interconnected biological, geological, and chemical cycles of the earth system including the multi-dimensional impacts of human activity.

Course Note: This course requires students to choose a lab time during registration.

EPS 6 is also offered as ESE 6. Students may not take both for credit. This course fulfills the EPS sub-discipline requirement of Climate, Atmosphere, and Oceans.

The course presumes basic knowledge in chemistry and physics at the high school level. Students will acquire additional skills and knowledge in these areas, as applied to environmental problems, as well as learning basic data analysis and coding skills.

Requires: Prerequisite/Co-requisite: Math 1B (or concurrent), or permission of the instructor

2025 Fall (4 Credits)

A Brief History of the Earth

MW 0130 PM - 0245 PM

Rebecca Fischer

This is an introduction to Earth and planetary science for EPS concentrators and an overview, for those outside the field, of the critical events and processes that have shaped the Earth's evolution and its place in the Solar System. The course is designed to highlight the processes, from the scale of microbes to that of tectonic plates, that drive the Earth's response to internal and external perturbations, and we will explore both the timescale of those perturbations and the limits of the Earth's resilience. By considering the full sweep of geologic time, from the Earth's formation to our modern world, the course will take advantage of a series of natural experiments to compare the Earth system during periods with and without atmospheric oxygen, animals, land plants, and polar ice sheets, and to compare it, on occasion, with other terrestrial planets.

Course Note: This course includes a mandatory lab component. There will be one field trip as part of this course, a one-day, local, in-person field trip.

The Fluid Earth: Oceans, Atmosphere, Climate, and Environment

MW 0900 AM - 1015 AM

Marianna Linz

This course introduces students to the fluid Earth, emphasizing Earth's weather and climate, the carbon cycle, and global environmental change. The physical concepts necessary for understanding the structure, motion and energy balance of the atmosphere, ocean, and cryosphere are covered first, and then these concepts are applied in exploring major earth processes. Examples from Earth's past history, on-going changes in the climate, and implications for the future are highlighted.

Course Note: Course includes lectures twice a week, and either a one hour section or a lab each week. This course fulfills the EPS sub-discipline requirement of Climate, Atmosphere, and Oceans.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 52

Global Geophysics

TR 0130 PM - 0245 PM

Jerry Mitrovica

This course provides a comprehensive introduction to global geophysics. The course serves as a bridge between introductory Earth science courses and higher-level courses in tectonics, seismology and planetary sciences, though no previous experience in Earth Science is necessary. Topics include plate tectonics, the Earth's composition and thermal state, rheology, ice age dynamics, mantle convection, the Earth's gravity field and geodesy, sea-level changes from deep time to modern, and paleoclimate.

Course Note: This course fulfills the EPS sub-discipline requirement of Geology, Geophysics, and Planetary Science.

Applied Mathematics 22a/b (or Mathematics 21a/b; or Mathematics 22a/b); Physics 15a/b (prior or concurrent) or Physical Sciences 12a/b; or permission of the instructor.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 54

Minerals and Rocks of the Earth and Planets

No meeting time listed

Rebecca Fischer

Minerals and rocks are the building blocks of the Earth and other planets, and understanding their properties and occurrences has applications to many diverse areas of Earth and planetary sciences. This course provides a comprehensive foundation of mineralogy and introductory petrology for students of Earth and planetary sciences, materials science, chemistry, or related fields. Topics include: bonding; symmetry; crystallography; deep Earth mineralogy; planetary mineralogy; petrology; and the bonding, structures, geology, and significance of a wide range of mineral and rock types. Weekly lab sections will cover crystal structures, symmetry, and the identification of a variety of common minerals and rocks.

Course Note: Once weekly lab section, 2 hours long. This course fulfills the EPS sub-discipline requirement of Geology, Geophysics, and Planetary Science.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 55

Earthquake Explorer

WF 1030 AM - 1145 AM

Seyed Mostafa Mousavi

Embark on a journey through the fascinating world of earthquake science, primarily through the lens of seismic data. In this introductory course to earthquake seismology, we will explore what we know (and don't know) about earthquakes and their impacts. We'll cover where and why earthquakes occur, and develop an understanding of how they initiate and generate seismic waves. Learn how to use seismic data to probe earthquake sources and discover the data types and models that illuminate how earthquake sequences evolve in space and time.

Course Note: This course fulfills the EPS sub-discipline requirement of Geology, Geophysics, and Planetary Science.

It is recommended that you take EPS 10 before this course.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 56

The History and Evolution of Life on Earth

MW 1030 AM - 1145 AM

Javier Ortega-Hernandez, Nadja Drabon

Within our solar system, Earth is distinguished as the planet with life. Living organisms are complex entities that originated from planetary processes, have been sustained by the same processes for approximately four billion years, and have fundamentally affected the functioning and composition of the Earth's surface and

E-PSCI 101

Course ID: 214499

Global Warming Science 101

2026 Spring (4 Credits)

W 0300 PM - 0545 PM

Eli Tziperman

An introduction to the science of global warming/climate change meant to assist students in understanding issues that often appear in the news and public debates. The course is meant for any STEM student with basic math preparation, not assuming prior science courses. Topics include the greenhouse effect and consequences of the rise of greenhouse gasses, including sea level rise, ocean acidification, heat waves, droughts, glacier melting, forest fires, expected changes to hurricanes, and more. An ability to critically evaluate observations, predictions, and risks will be developed throughout. The students will be guided in a hands-on, in-class quantitative analysis of climate observations, models, and feedbacks using provided Python Jupyter notebooks.

Course Note: This course fulfills the EPS sub-discipline requirement of Climate, Atmosphere, and Oceans. E-PSCI 101 is also offered as ESE 101. Students may not take both for credit. For SB students: this course can only count as a science elective in the concentration requirements, and SB students must enroll in E-PSCI 101. AB students may enroll in either E-PSCI 101 or ESE 101 to meet their concentration requirements.

Basic calculus and ordinary differential equations, as covered, for example, by Math 19a or Math 21b or permission of instructor. Some previous exposure to programming (in any programming language) is assumed, and Python will be introduced as part of the course. The course will introduce the students to various science subjects, but no prior college-level science knowledge is assumed.

FAS Divisional Distribution: Science & Engineering & Applied Science

Introduction to Planetary Materials and Earth Resources

Course ID: 109527
2025 Fall (4 Credits)

TR 0430 PM - 0545 PM

Instructor Permission Required

Stein Jacobsen

A comprehensive introduction to how the principles of mineralogy, phase equilibria, and the compositions of terrestrial and extraterrestrial materials are used to understand the evolution of the Earth and its resources. The course will discuss how we know that the Earth's crust has more than sufficient resources for its human population.

Course Note: Course includes a weekly lab and a 3-4 day virtual field trip. This course requires students to choose timed sections during registration.

This course fulfills the EPS sub-discipline requirement of either Geobiology, Geochemistry, and Earth History, or Geology, Geophysics, and Planetary Science.

An introductory earth and or planetary science course and a course in college-level chemistry or equivalent.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 112

Thermodynamics

Course ID: 161215
2026 Spring (4 Credits)

MW 1200 PM - 0115 PM

Instructor Permission Required

Scot Martin

Fundamental concepts and formalisms of conservation of energy and increase of entropy as applied to natural and engineered environmental and biological systems. In addition to lectures, pedagogical approach includes

real-world observations and applications through student presentations and projects.

Course Note: E-PSCI 112 is also offered as ES 112. Students may not take both for credit. Undergraduate engineering students should enroll in ES 112. This course fulfills the EPS sub-discipline requirement of Climate, Atmosphere, and Oceans. Total class capacity of 18 includes students in both ES 112 and EPS 112. Please see course page for lottery instructions.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 120

Introduction to Planetary Sciences

MW 0300 PM - 0415 PM

Roger Fu

An overview of the key physical and chemical processes that occur on planetary bodies of the solar system and a survey of current topics of research.

Course Note: Course includes one additional 3-hour lab, one 3-hour meeting for telescopic observations, and a field trip. The lab and telescopic observations are held from 7:00-10:00 PM due to observatory and telescope access.

Given in alternate years. This course fulfills the EPS sub-discipline requirement of Geology, Geophysics and Planetary Science. Given in alternate years.

Physics 15a or equivalent or permission of instructor. Introductory EPS class such as EPS 10 recommended.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 129

Climate and Atmospheric Physics Laboratory

R 1245 PM - 0330 PM

Marianna Linz

This course will take a hands-on approach to learning climate and atmospheric physics. Some of the topics covered will include the Greenhouse effect, hurricanes, climate variability, the jet stream, and global climate modeling. Students will learn to create effective data visualizations and read scientific literature. Each week will have one 165-minute session to perform laboratory experiments, run models, or analyze data. In this flipped-classroom environment, knowledge transfer will occur primarily outside of class through readings and pre-class assignments in preparation for each session.

Course Note: E-PSCI 129 is also offered as ESE 129. Students may not take both for credit. For SB students: this course can only count as a science elective in the concentration requirements, and SB students must enroll in E-PSCI 129. AB students may enroll in either E-PSCI 129 or ESE 129 to meet their concentration requirements. This course fulfills the EPS sub-discipline requirement of Climate, Atmosphere, and Oceans. This class meets in the Science and Engineering Complex (SEC) 1.216 EnviroLab on the Allston campus.

Physics 12a/15a/16, Math 21a (b strongly recommended) or equivalent or permission of instructor.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 131

Introduction to Physical Oceanography and Climate

TR 1030 AM - 1145 AM

Eli Tziperman

Observations and fundamentals of ocean dynamics, from the role of the oceans in climate change to beach waves. Topics include the greenhouse effect and the role of the oceans in global warming; El Niño events in the equatorial Pacific Ocean; the wind-driven ocean circulation and the Gulf Stream; coastal upwelling and fisheries; temperature, salinity, the overturning ocean circulation and its effect on global climate stability and variability; wave motions: surface ocean waves, internal waves, tsunamis, and tides; ocean observations by ships, satellites, moorings, floats and more. A field trip to the Woods Hole Oceanographic Institution on Cape Cod will be an opportunity to learn about sea-going oceanography. Students will be doing a group video project and group in-class presentations. Scientific computation and visualization methods will be introduced (students may choose either Matlab or Python) and will be used for some homework assignments.

Course Note: EPS 131 is also offered as ESE 131. Students may not take both for credit. This course fulfills the EPS sub-discipline requirement of Climate, Atmosphere, and Oceans. Given in alternate years.

Observing the Ocean: Measurements and Instrumentation

TR 0900 AM - 1015 AM

Fiamma Straneo

Course ID: 226212

2025 Fall (4 Credits)

Instructor Permission Required

Is the ocean warming? Where and why is sea level rising? Where does the freshwater from Arctic ice melting go? Using real-world examples, this course will provide an overview of why and how we measure the ocean, focusing primarily on its physical properties. It will cover sensors, instruments and platforms, best field practices in data collection and calibration, fieldwork organization implementation, and ocean data analysis. During the course, students will build, test, and calibrate an ocean profiling instrument. Students will participate in a one-day research cruise where they will collect data using both the instruments they built and other traditional oceanographic instruments.

Course Note: This course includes a weekly 2-hour lab in Allston and two one-day field trips. EPS 135 is also offered as ESE 135. Students may not take both for credit. This course fulfills the EPS sub-discipline requirement of Climate, Atmosphere, and Oceans.

The course is designed for upper-level undergraduates. There are no specific prerequisites, but background in environmental or physical sciences, experience in coding (Python, R, or Matlab), or statistical analysis is recommended.

E-PSCI 141

Isotope and Trace Element Geochemistry and Geochronology

TR 0430 PM - 0545 PM

*Stein Jacobsen*Course ID: 122074
2026 Spring (4 Credits)

The origin of the element and isotope distribution in the Earth and the Solar System. Closed system radioactive decay, isotope fractionation, mass balance and mixing. Application of Rb-Sr, Sm-Nd, U-Th-Pb, Lu-Hf, Re-Os and K-Ar isotope systems for geochronology and as tracers for geological processes. Noble gas geochemistry. Extinct nuclides. Cosmogenic nuclides. U-Th-series nuclides. Planetary isotopic evolution. Stable isotope geochemistry. Application of H, C, N, O, and S isotopes as tracers of geochemical and biogeochemical processes.

Course Note: Course includes a weekly two-hour lab to be arranged. This course fulfills the EPS sub-discipline requirement of Geobiology, Geochemistry, and Earth History, or Geology, Geophysics and Planetary Science. Given in alternate years.

A course in college-level chemistry or equivalent; EPS 51 or EPS 110; or permission of instructor.

Scot Martin

Part 1: Intersection of environment/industry, including decarbonization of the materials industry. Chemistries for cement and steel production without carbon dioxide emission, the smelting industry for extraction of metals from ores, present-day and possible futures for chemistry of a hydrogen economy, and chemistry of emerging battery technologies. Part 2: Environmental processes of chemistry, such as alkalinity of ocean acidification, pH and pE as master variables for the chemistry of an ecosystem, drinking and wastewater treatment, and soil chemistry for agriculture.

Course Note: E-PSCI 164 is also offered as ESE 164. Students may not take both for credit. This course fulfills the EPS sub-discipline requirement of Climate, Atmosphere, and Oceans.

Physical Sciences 11 or equivalent in general chemistry.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 165

Introduction to Seismology

TR 0300 PM - 0545 PM

Miaki Ishii

Introduction to seismology with a focus on conceptual understanding of seismic phenomena. Emphasis will be on earthquakes, e.g., detection, mechanism, characteristics, statistics, hazard, and relationship to dynamics. Broader topics such as the types of seismological data and inferences of the Earth's internal structure also will be covered.

Course Note: Depending upon the availability of seismic instrument expert, there may be one field trip to seismic station at Harvard, MA. This course fulfills the EPS sub-discipline requirement of Geology, Geophysics, and Planetary Science. Given in alternate years.

Mathematics 21ab, 23ab, 25ab, or applied math 22ab.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 166

State-of-the-Art Harvard Climate Observatory and Associated Instrumentation

MWF 0130 PM - 0245 PM

James Anderson

ESE/EPS 166 engages the new Harvard Climate Observatory that will fundamentally herald a new era in both climate research and the development of strategic approaches to advancing the climate impact on public policy. The central objective of the New Climate Observatory is to address this problem by introducing, for the first time, the development of a new generation of innovative technology that takes explicit advantage of recent major advances in Harvard-based instruments and optical designs in combination with advanced solar powered stratospheric aeronautical design. The new solar powered stratospheric aircraft that together constitute the Climate Observatory engage multiple recent design innovations in photovoltaics, energy storage, as well as guidance and control. Together these enable a combination of long duration solar powered observing systems, each targeted at the highest priority risk factors that threaten global societal stability. The resulting observations will, for the first time, provide the irrefutable evidence needed for quantitative forecasts of the dominant risk factors stemming from the global use of fossil fuels. While satellites have for years dominated the federal climate programs, for the purpose of developing tested and trusted quantitative forecasts of risk, satellites engender significant disadvantages. In sharp contrast to satellite systems, the new Harvard Climate Observatory provides, for the first time, orders of magnitude improvement in spatial and temporal resolution observations. ESE/EPS 166 will focus explicitly on this new generation of climate observations, forecasting, and resulting advances in public policy. An important part of the course is the display of Harvard flight instruments in the laboratory and the strategy for addressing unsolved scientific problems with new instrumentation.

Course Note: EPS 166 integrates the challenges of climate scientific objectives with the strategy for instrument innovation, the lab is also integrated with the course structure.

EPS 166 is also offered as ESE 166. Students may not take both for credit.

Math 1a, b; PS 11 or equivalent; PS 12a, b (or Physics 15a, b or AP 50a, b)

Field and Lab-Based Seminar on Local Pollution Issues

TR 1030 AM - 1145 AM

*Instructor Permission Required**Elsie Sunderland*

This course provides a cross-disciplinary overview of environmental science and how research contributes to public policy and human health risk assessment through a case study of a local pollution issue. The course will focus on exposing students to a combination of field, lab and modeling techniques used in environmental sciences through an intensive study of factors affecting the bioaccumulation of contaminants on Cape Cod, MA. The class will include field visits, lab work, and interactive group research aimed at synthesizing research findings. Experience conducting multidisciplinary environmental research and data analysis will be provided. Course Activities: Lectures, discussions, presentations, field/lab research, data analysis.

Course Note: EPS 169 is also offered as ESE 169. Students may not take both for credit. The total class capacity of 18 includes students in both EPS 169 and ESE 169. This course fulfills the EPS sub-discipline requirement of Climate, Atmosphere, and Oceans.

Two semesters of undergraduate chemistry including Physical Sciences 1 or Physical Sciences 11; Mathematics 1a & 1b. Knowledge of basic statistics is also helpful.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 171 (01)Course ID: 112745
2026 Spring (4 Credits)**Structural Geology and Tectonics**

MW 0900 AM - 1015 AM

John Shaw

An introduction to the deformation of Earth materials, including the processes of mountain building and plate tectonics, faulting and earthquakes, folding, and ductile deformation of rocks at high temperatures. Structures are examined using geologic maps, cross sections, geophysical data, satellite imagery, microscopic analysis, analog experiments, and numerical methods. Labs emphasize the applications of structural geology in the energy and environmental industries, and for assessing natural hazards.

Course Note: Course includes a weekly three-hour lab to be arranged and one field trip. This course fulfills the EPS sub-discipline requirement of Geology, Geophysics, and Planetary Science. Given in alternate years.

EPS 10 or EPS 55, an equivalent course, or permission of the instructor.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 174Course ID: 120728
2025 Fall (4 Credits)**Field Experiences in Earth and Planetary Sciences***No meeting time listed**Instructor Permission Required**Nadja Drabon*

Attend a domestic or overseas geological field program of 3-6 weeks duration to learn methods of obtaining, synthesizing, and interpreting field observations.

Course Note: Permission of instructor. Field programs are selected individually by students with the advice and approval of the instructor. Students must notify the instructor and Academic Programs Manager of intention to enroll by the course registration deadline of the preceding term.

This course fulfills the EPS sub-discipline requirement of either Climate, Atmosphere, and Oceans, or Geobiology, Geochemistry, and Earth History, or Geology, Geophysics, and Planetary Science.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 174Course ID: 120728
2026 Spring (4 Credits)**Field Experiences in Earth and Planetary Sciences***No meeting time listed**Instructor Permission Required**Roger Fu*

Attend a domestic or overseas geological field program of 3-6 weeks duration to learn methods of obtaining, synthesizing, and interpreting field observations.

Course Note: Permission of instructor. Field programs are selected individually by students with the advice and approval of the instructor. Students must notify the instructor and Academic Programs Manager of intention to

enroll by the course registration deadline of the preceding term.

This course fulfills the EPS sub-discipline requirement of either Climate, Atmosphere, and Oceans, or Geobiology, Geochemistry, and Earth History, or Geology, Geophysics, and Planetary Science.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 187 (01)

Biogeochemistry

TR 0900 AM - 1015 AM

Ann Pearson

Introduction to biological and organic chemistry of the Earth's environment. Primary focus on formation, processing, and preservation of organic carbon, with emphasis on paleoenvironmental applications and on processes occurring at the molecular level.

Course Note: Intended primarily for undergraduates. This course fulfills the EPS sub-discipline requirement of Geobiology, Geochemistry, and Earth History. Given in alternate years.

A course in college-level chemistry or equivalent. Chemistry 17 or 27 also recommended, but optional. EPS 53 strongly recommended.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 208

Physics of Climate

TR 1030 AM - 1145 AM

Zhiming Kuang

Overview of the basic features of the climate system (global energy balance, atmospheric general circulation, ocean circulation, and climate variability) and the underlying physical processes.

Course Note: This course includes a one-time computer lab to be arranged

Applied Mathematics 105 (may be taken concurrently); Physics 15 or Physical Sciences 12a,b; or permission of the instructor.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 220

A Survey of Planetary Sciences

MW 0300 PM - 0415 PM

Roger Fu

An overview of the key physical and chemical processes that occur on planetary bodies of the solar system and a survey of current topics of research.

Course Note: Course includes one additional 3-hour lab, one 3-hour meeting for telescopic observations, and a field trip. The lab and telescopic observations are held from 7:00-10:00 PM due to observatory and telescope access.

Given in alternate years.

Physics 15a or equivalent or permission of instructor. Introductory EPS class such as EPS 10 recommended.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 236

Environmental Modeling and Data Analysis

TR 0130 PM - 0245 PM

Steven Wofsy

Graduate-level introduction to environmental modeling and data analysis: data visualization, statistical inference, Bayes Theorem, optimal estimation, adjoint methods, Monte Carlo methods, time series analysis, denoising; principles and numerical methods for chemical transport and inverse models.

Course ID: 117399
2026 Spring (4 Credits)

2025 Fall (4 Credits)

Course ID: 207622
2026 Spring (4 Credits)

Course ID: 120783
2026 Spring (4 Credits)

Course Note: Focused on computer-based projects. Suitable for: graduate students and advanced undergraduates in Earth and Planetary Sciences, Environmental Science and Engineering, Applied Math, Chemistry, and Physics. At MIT: EAPS, Civil & Environmental. Helpful to have preparation in differential equations, or atmospheric science, but not required.

Applied Mathematics 105; a course in atmospheric chemistry (EPS 133 or 200 or equivalent); or permission of the instructors.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 240

Isotope and Trace Element Geochemistry and Geochronology

TR 0430 PM - 0545 PM

Stein Jacobsen

The origin of the element and isotope distribution in the Earth and the Solar System. Closed system radioactive decay, isotope fractionation, mass balance and mixing. Application of Rb-Sr, Sm-Nd, U-Th-Pb, Lu-Hf, Re-Os and K-Ar isotope systems for geochronology and as tracers for geological processes. Noble gas geochemistry. Extinct nuclides. Cosmogenic nuclides. U-Th-series nuclides. Planetary isotopic evolution. Stable isotope geochemistry. Application of H, C, N, O, and S isotopes as tracers of geochemical and biogeochemical processes.

Course Note: Course includes a weekly two-hour lab to be arranged. Given in alternate years.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 244

Atmospheric Evolution and Habitability of Terrestrial Planets

MW 1030 AM - 1145 AM

Robin Wordsworth

Earth is our best-known example of a rocky or 'terrestrial-type' planet, but there are many others. To build deep understanding of Earth's evolution and habitability, we must also study Venus and Mars, as well as more distant worlds such as Enceladus, Titan and Pluto. Even further afield, our growing knowledge of terrestrial exoplanets is beginning to revolutionize thinking on our own planet's place in the cosmos. The aim of this course is to provide a wide overview of the state of the art of this fascinating field, with a focus on in-class discussion of the primary literature. In addition, this year we will be exploring the responsible use of generative AI to accelerate learning and facilitate research in this area.

FAS Divisional Distribution: Science & Engineering & Applied Science

E-PSCI 247

Ocean Ridges and the Earth System

MW 0430 PM - 0545 PM

Charles Langmuir

Course will present our current knowledge of the ocean ridge system where two thirds of Earth's crust is continually being created. We will examine the progressive understanding of ocean ridges from a historical perspective, emphasizing the process of scientific discovery. Topics include melt generation in the mantle, magmatic processes in the crust, formation of ocean ridge topography, faulting and tectonics, hydrothermal systems, manifestations in the overlying water column, and the unique ecosystems associated with vents. Approaches must be inherently interdisciplinary, including geochemistry, geophysics, geology, hydrothermal systems, and biology. The place of the ocean ridge system within the overall Earth system will be emphasized.

Course Note: This course includes a weekly two-hour lab to be arranged.

One of: EPS 10, EPS 50, or GENED 1018; or permission of instructor.

Course ID: 223988
2026 Spring (4 Credits)

W 1245 PM - 0245 PM

Jerry Mitrovica

This course will cover a wide range of topics related to applications of solid Earth geophysical theory and modeling to problems in paleoclimate research. The course will be run as a seminar course that deals with a different topic each week. Students will present a seminar on the topic, lead a discussion with other students and an invited expert who will join for the last 30 minutes of the class (virtually or in-person, depending on their location). Topics to be covered include: the impact of mantle convection-induced dynamic topography (DT) on ancient sea level indicators, ice sheet bedrock elevation, large scale continental drainage patterns, atmospheric circulation, and biodiversity; connections of ice age dynamics to ice sheet stability, river evolution, volcanism, catastrophic lake floods, and ice sheet stability; sea level fingerprinting; rotational stability of the Earth and the analysis of ancient eclipse records; changes in Earth's shape and Milankovitch cyclicity.

Early Earth Habitability: Conditions for Life's Emergence 2025 Fall (4 Credits)
W 1245 PM - 0245 PM *Instructor Permission Required*
Nadja Drabon

This seminar investigates the pivotal question: When did Earth become habitable? By exploring the dynamic processes that shaped our planet's ability to support life during the Hadean Eon (>4.02 billion years ago), we will address the interplay of key factors such as the declining meteorite impact flux, the availability of liquid water, and the role of active surface cycling. The discussion will connect these elements to key hypotheses about the origins of life, the development of microbial ecosystems, and the formation of continents. Throughout the seminar, students will develop a comprehensive understanding of the factors that contributed to Earth's habitability. The seminar places a strong emphasis on student-driven inquiry. Weekly discussions will focus on thought-provoking research papers, often presenting sharply contrasting perspectives. These papers will be selected in collaboration with the students, ensuring the course direction aligns with the group's interests. Students will critically analyze these papers, engaging with the latest debates and discoveries in Earth and Planetary sciences. This seminar is ideal for those passionate about Earth Sciences, Planetary Sciences or Astrobiology, and who are eager to actively participate in shaping the course content and engaging in interdisciplinary discussions.

Course Note: This course is for graduate students and advanced undergraduate students.

FAS Divisional Distribution: Science & Engineering & Applied Science

CHNSHIS 113 (01)

Life and Death in Late Imperial China: Social History of the 10th to 19th Centuries

MW 1030 AM - 1145 AM

Michael Szonyi

This course is a survey of the social and cultural history of China from the Song to the mid-Qing (roughly from 1000 to 1800). The main topics discussed include urbanization and commerce; gender; family and kinship; education and the examination system, and religion and ritual. The main goal of the course will be to explore the relationship between social and cultural changes and political and intellectual developments.

CHNSHIS 135 (01)

The Mongol Empire and World History: From Steppe Confederation to Eurasian Empire, c.1206-1368

Course ID: 226319
2026 Spring (4 Credits)

This course seeks to provide a comprehensive introduction to the study of Mongol Eurasia anchored by the theme of globalization. The Mongol Empire has variously been credited with the inaugural establishment of a globalized world with unprecedented religious toleration and socio-economic exchange. Yet, the Mongols have also been maligned for the mass slaughter of their conquests, brutal deportation policies as well as destruction of Islamic and Chinese urban societies. Between the twin poles of efflorescence and catastrophe lies a rich geography to explore. Who was this steppe people that came to rule the largest contiguous empire in history? What underwrote their rise? How did they order such a vast realm? How much was the Mongol period a watershed for globalization? What legacy did they leave behind for successor states, cultures and the globe? We begin by looking closely at the nature of the agglomeration of peoples that eventually became known as the Mongols and how state formation in the steppe created the momentum for conquest. Next, we explore how steppe military culture combined with new technologies and operational strategies that empowered the Mongol military machine. We then turn to questions of localized rule and gender in Mongol-dominated societies. Our third approach is to look at commercial and material cultural exchange through the lens of globalization and localization: we assess the changing vectors for exchange as well as how cultural items themselves moved and transformed. This section peaks with a discussion of how historiography under the Mongols can serve as a proxy for multi-valent elite perspectives of global empire that were simultaneously localized to their sites of production. Last, we look at how Mongol political culture and imperial practice conditioned that of successor states.

This course will be taught by Aaron Molnar.

CHNSHIS 146 (01)

The Modern History of Rural China

TR 1030 AM - 1145 AM

Michael Szonyi

It's only in the last twenty years that China has become known as a place of cities and factories. Before then, the majority of Chinese people lived not in cities but in villages in the countryside, and made their living from agriculture. This lecture/discussion course, intended mainly for undergraduates, will introduce you to the modern history of rural China. We'll approach that history chronologically, thematically, and historiographically. No background knowledge of China is required, but the course might interest you even if you have some previous background, because it will show you the People's Republic of China from a very different angle than what you've likely encountered before: that of its villages and the people who live in them. You'll come to appreciate their perspective better through taking their role in two interactive games. You'll also learn why the fate of China's countryside matters to the future not only of China but also the whole world.

CHNSLIT 134

Strange Tales: The Supernatural in Chinese Literature

TR 1030 AM - 1145 AM

Thomas Kelly

This course introduces students to traditional Chinese literature by focusing on "tales of the strange." We will examine how ghosts, demons, fox spirits, and other liminal creatures haunt the literary imagination, stretching the possibilities of storytelling. Students will gain familiarity with masterpieces of Chinese literature and their intriguing afterlives in performance, film, and popular culture. Our discussions will consider how literary accounts of ghosts and the supernatural grapple with issues of gender and sexuality, the cultural meanings of death, the boundaries of human community, and the experience of historical trauma. We will focus on developing skills in close reading, while critically engaging theories of the "strange." No background in Chinese is required.

FAS Divisional Distribution: Arts and Humanities

CHNSLIT 140 (01)

The Greatest Chinese Novel

T 1200 PM - 0245 PM

Wai-ye Li

The Story of the Stone (also known as The Dream of the Red Chamber) by Cao Xueqin (1715?-1763) is widely recognized as the masterpiece of Chinese fiction. It is also a portal to Chinese civilization. Encyclopedic in scope, this book both sums up Chinese culture and asks of it difficult questions. Its cult status also accounts for modern popular screen and television adaptations. Through a close examination of this text in conjunction with supplementary readings and visual materials, the seminar will explore a series of topics on Chinese culture, including foundational myths, philosophical and religious systems, the status of fiction, conceptions of art and the artist, ideas about love, desire and sexuality, gender roles, garden aesthetics, family and clan structure, and definitions of socio-political order.

Course Note: This course consists of a one-hour lecture followed by a two-hour seminar.

FAS Divisional Distribution: Arts and Humanities

CHNSLIT 235 (01)

Theater and Theatricality in Early Modern China

W 0945 AM - 1145 AM

Thomas Kelly

This seminar charts the development of Chinese dramatic literature from the fourteenth to the seventeenth centuries. We will focus on the close reading of major works in the zaju, xiwen, and chuanqi forms, examining how the theater shaped new practices of writing and reading. The seminar will follow two central themes: 1) the shifting relationship between the figures of the playwright and the actor; 2) the interplay between the spaces of the page and stage. Engaging with recent scholarship, we will reflect on how modes of theatrical performance and spectatorship transformed broader understandings of self and society. Our discussions will seek new frameworks for approaching the place of the theater in Chinese literary history.

Reading ability in Literary Chinese is required.

FAS Divisional Distribution: Arts and Humanities

CHNSLIT 236 (01)

China's Banned Book: Reading Jin Ping Mei (Conference Course)

No meeting time listed

Thomas Kelly

This course will introduce students to the controversial masterpiece of Chinese fiction, The Plum in the Golden Vase (Jin Ping Mei). Censored for its erotic content, this sensational book had a profound impact on the development of Chinese fiction. A landmark in the history of the novel, The Plum in the Golden Vase shifts

attention away from worthy heroes to examine the everyday exploits and desires of ordinary people. The work of an anonymous author, *The Plum in the Golden Vase* revels in sensory excess (greed, murder, intoxication, and lust), illustrating the vivid details of Chinese urban life. We will focus on developing skills in close reading, while using this monumental work to survey the flourishing cultural landscape of early modern China. Our discussions will situate the novel alongside recent scholarship on gender and sexuality, material culture, and performance. We will also hold class viewing sessions in the Harvard-Yenching Library and the Harvard Art Museums. Students with Chinese language skills will be encouraged to read the original text.

FAS Divisional Distribution: Arts and Humanities

CHNSLIT 245R (01)

Topics in Sinophone Studies - Modern Chinese Fiction on the Periphery

Course ID: 121041
2026 Spring (4 Credits)

The Politics of Sound: Ethnicity, Gender, and Identity in Chinese

Course ID: 226318
2026 Spring (4 Credits)

Songscape

No meeting time listed

Xiaofei Tian

This course examines Chinese songs, and comments on songs, throughout history. It considers how the elite's collection and reception of popular songs, and their own composition of them, are framed by, negotiate with, and often exceed the ideology of poetry and music rooted in the early classics and Confucian political-cultural theory. It also considers issues of ethnicity, gender, identity, and politics embroiled in popular songs. Readings include songs in "The Music Monograph" in the fifth-century *History of Song*; the southern and northern yuefu in the sixth-century *Record of Ancient and Modern Music*; regional folksongs and ci lyrics of the Tang, Five Dynasties, and the Song; the sanqu arias and popular songs in dialects from Yuan, Ming, and Qing dynasties; the socialist songs in Maoist China; and the folksongs collected in *The Complete Collectanea of Chinese Ethnic Folk Arts*, a massive compendium commissioned by the Chinese Ministry of Culture and the National Ethnic Affairs Committee in the post-Cultural Revolution era.

Advanced reading skills in Classical and Modern Chinese.

CHNSLIT 253 (01)

Chinese Aesthetic and Literary Thought

Course ID: 226314
2026 Spring (4 Credits)

T 1200 PM - 0245 PM

Wai-yee Li

This course will introduce students to key concepts in Chinese aesthetic and literary thought through close analysis of primary texts. The goal is to understand the functions of keywords such as wen 文, zhi 志, qing 情, shen 神, yi 意, or qi 氣 in the contexts of broader arguments about tradition, language, socio-political order, and human nature. We will explore the meanings of authorship, intention, expression, communication, and interpretation in the Chinese tradition. The focus will be on pre-Qin and Han texts, but there will be forays into materials from later periods.

CHNSE BB

Elementary Modern Chinese

TR 0900 AM - 1015 AM

Fangzheng Zhang

This is a continuation (second semester) of the Elementary Modern Chinese. It is designed for students who have completed the first semester of Elementary Modern Chinese I (Chinese Ba) or the equivalent. The course will further develop students' communicative skills in the listening and speaking modalities, and at the same time shift the focus of instruction gradually towards reading and writing. It provides more practice on syntactic structures, usage and their communicative functions, and prepares students for intermediate-level classes.

Course Note: No auditors. May not be taken Pass/Fail.

Requires: Prerequisite: Chinese BA or equivalent.

Advanced Modern Chinese for High-Proficiency Learners

MWF 1200 PM - 0100 PM

Xiaoshi Yu

Continuation of Chinese 140xa. This course aims at further developing students' ability to use Chinese in a more

advanced way. Students will be introduced to a wide variety of topics and literary genres through in-depth reading and focused discussion of classical works of Chinese literature. The course will focus on accurate comprehension of texts, expansion of vocabulary for expressing more refined and sophisticated ideas, and development of ability to process complex sentence structures used mainly in formal speech and literary writing. The objectives of this course include: 1) enabling students to gain a deeper understanding of Chinese cultural conventions and social norms in specific social and historical backgrounds, 2) building students' ability to "read between the lines" and discern the subtle connotations often present in Chinese speech and writing, 3) enhancing students' writing skills and improving students' ability to express opinions and feelings in a more accurate, appropriate and coherent manner, and to offer more detailed and vivid descriptions and narrations.

Course Note: No auditors. May not be taken Pass/Fail.

Chinese 140xa or equivalent.

Korean Stars

MW 0130 PM - 0245 PM

Chan Yong Bu

Course ID: 224288
2026 Spring (4 Credits)

What makes stars "shine?" In other words, what are the conditions for stardom? In this course, we will explore how stars embody the intersection of constantly changing media infrastructures; media aesthetics; social norms concerning gender, race, age, and economic status; and geopolitics surrounding Korea. From the 1910s-1930s stardom of silent-film narrators (*pyōnsa*) in colonial Korea, to the global success of Korean stars in the fields of film, music, drama, fashion, and gaming today, this course will map the trajectories of modern and contemporary media culture in Korea—and beyond—with an emphasis on stars. We will develop the analytical capacities to probe the recurring themes a star consolidates within the specific historical contexts of Korea across a series of their works. We will also consider a range of media technologies, filming and editing techniques deployed for the purpose of either retaining or changing the star's image, and the various modes of interplay between a star and their audience.

No background in Korean is required.

FAS Divisional Distribution: Arts and Humanities

EAFM 124 (01)

Theorizing Korean Cinema

T 1245 PM - 0245 PM

Chan Yong Bu

Course ID: 226286
2026 Spring (4 Credits)

How has the pairing of "Korean" and "cinema" mutually affected their conceptualizations? What are/were the epistemological and material vectors that constitute each word, and how do these vectors bridge the two terms, or conversely, bring them into them conflict? What specific modes of mapping the world have arisen from this combination? This undergraduate seminar sketches a trajectory of cinema as an art of formulating subjectivity in Korea, from the colonial period to the present. Bringing together multiple understandings of "technology"—in relation to mass media, natural science and engineering, and the operation of governmentality—we will probe how cinema has been a major site of technologies, a central node at which the fostering of pliant subjects for imperialism, authoritarianism, neoliberalism, and heteronormative male-centered society in general; the navigation and critique of these very power relations; and encounters with new science and mass media technologies all intersected in Korea. Instead of defining Korean cinema as the homogenous realization of some unchanging cultural essence of Korea, this seminar approaches it as a conjunction of diverse modes of addressing the subject's place within the changing techno-geopolitical, infrastructural, and ecological landscapes surrounding Korea. In tandem with an in-depth reading of each film's aesthetic and narrative features, we will examine the rationales behind the categorization of films as Joseon film, women's film, experimental film, Minjok film, Korean New Wave, and Korean blockbusters, to name a few, as proposed by film directors, critics, scholars, film societies, and government institutions. The focus of the seminar is placed on these cinematic genres' (1) approach to the medium of film, audience, and screening venue, (2) their resonance with social movements and theorizations of cinema abroad, (3) the convergence of film aesthetics and infrastructural changes (train, car, factory, etc.) and new media technologies (computer animation, VR, drone, GoPro, etc.), and (4) their frustration or consolidation of the national, ideological, gendered, and epochal boundaries propping up the notion of "Korean." Building on these concerns, students are encouraged to explore the interplay of multiple technologies through which diverse forms of subjectivity are contested, questioned, and appropriated, and to respond to the central questions posed by the seminar in their final projects.

EAFM 201 (01)

Media Mix: Representations and Meaning Between Media in Japan:

Seminar

No meeting time listed

Alexander Zahlten

Course ID: 108471
2026 Spring (4 Credits)

This course introduces ways of understanding the complex media systems we live in. Drawing on a wide range of media theories it maps different histories of the interconnection of media in Japan, from "old" to "new" media. The course will explore the early ties between theater, literature and cinema, fascist media strategies, the

popularization of the media mix by anime and publishing companies, current routes between manga, anime, light novels, films and games, or the emerging platform economy. It will consider the consequences of media mix for, among others, our understanding of nation, gender, memory, and the concept of world. Basic Japanese language skills are recommended, though not required, for this course.

Media Cultures in the People's Republic of China

R 1245 PM - 0245 PM

Jie Li

This graduate seminar examines the changing mediascape in China from the 1950s to the present. Every week, we will focus on one or two different media forms or technologies, from propaganda posters, photography, cinema, radio, loudspeakers, cassettes, to television, video, Internet, surveillance systems, and digital platforms. We will ask questions such as: How have mass media represented and transformed Chinese culture, history, and society? To what extent was the Chinese revolution a media revolution, and is there a media revolution going on now? How have various media served propaganda and surveillance, facilitated grassroots activism and creativity, circulated as commodities or connected communities? How have media technologies affected perception, experiences, and memories of socialism and postsocialism, as well as the aesthetics, ethics and everyday practices of every decade? What might be specific or special about each medium, and how have different types of media interacted in the Chinese context?

EASTD 98K (01)

Economic Governance in East Asia

R 1245 PM - 0245 PM

Daniel Koss

East Asia has given rise to models of development with distinct visions for the relationship between the state and the market. Hallmarks of the designs are powerful ministries, gigantic conglomerates, state-supervised labor unions, and spectacular corruption. The first part of the tutorial revisits four decades of "miraculous" growth in Japan and the Asian Tiger economies (South Korea, Taiwan, Hong Kong, and Singapore), in order to illuminate underlying development strategies from a political science perspective, including through theories of late industrialization and varieties of capitalism. The second part of this course focuses on China, whose strategists have drawn on its neighbors' experience. It highlights the vast differences between economic regions in China (the Pearl River versus the Yangtze Delta, versus lagging Western regions), as well as the significant transformation of the country's approach over the last three decades. Students will develop a deeper comprehension of phenomena such as national champions, tycoons in the digital economy, Communist party control, international expansion, and slogans such as "Made in China 2025." Throughout the course, we will occasionally go back in time to historical foundations of economic governance. This junior tutorial provides individualized support in the research process toward a final paper.

Course Note: This course counts toward the Junior Tutorial requirement for East Asian Studies concentrators.

Buddhism in the Anthropocene

TR 0300 PM - 0415 PM

Ryuichi Abe

What can Buddhism teach us about surviving and thriving in the face of ecological crisis? This course examines the challenges and possibilities of life on a global planet from a Buddhist perspective. Organized thematically around Buddhist concepts such as karma, pollution, suffering, and interdependence – and paired with the material realities of environmental degradation and consumption practices – the course investigates how Buddhists around the globe are responding to and contributing to pressing issues like climate change, extreme weather events, radical environmental degradation, plummeting biodiversity, pollution, waste and wasting, melting glaciers, rising sea levels, food insecurity, and related phenomena. Drawing on ethnographic writings from Japan, China, Inner Asia, Nepal, Vietnam, and other regions, we will explore how Buddhist practitioners and communities are conceptualizing and addressing the unprecedented impact of human beings on global environmental processes. In doing so, we will also critically engage with the broader issues surrounding Buddhist environmentalism (e.g. Buddhist ecology and greening of Buddhism).

This course will be taught by Paulina Kolata: <https://ealc.fas.harvard.edu/people/paulina-kolata>

EASTD 112 (01)

Buddhism and the Senses [aka "Buddhist stuff"]

TR 0300 PM - 0415 PM

How does Buddhism smell, taste, sound, look, and feel to touch? In this course, we will consider how bodies experience the divine presence, religious norms and regulations, spaces, and religious imaginaries. Through the lens of Buddhism, we will engage with the sensory and embodied dimensions of religious practices, both through the experiences of practitioners and our own. From spirit possession, to carving religious statues, cooking Buddhist feasts, and making and smelling incense, we will uncover how religious worlds come into being through the senses and embodied practice. This course will also delve into the meaning of religious affects and embodied realities of Buddhism, while offering a theoretical introduction to material religion.

This course will be taught by Paulina (Paula) Kolata.

East Asian Religions: Traditions and Transformations

TR 0130 PM - 0245 PM

James Robson

Course ID: 126199

2026 Spring (4 Credits)

This course provides an introduction to the study of East Asian religions. It covers the development of Buddhism, Daoism, Confucianism and Shinto. It is not a comprehensive survey, but is designed around major conceptual themes, such as ritual, image veneration, mysticism, meditation, death, and category formation in the study of religion. The emphasis throughout the course is on the hermeneutic difficulties attendant upon the study of religion in general, and East Asian religions in particular.

Course Note: Offered jointly with the Divinity School as 3010.

FAS Divisional Distribution: Arts and Humanities

EASTD 143A (01)

Digital Tools and Methods in East Asian Humanities: No-coding Approach

W 0900 AM - 1145 AM

Kwok-leong Tang

This course is designed for students in East Asian humanities with no prior background in digital literacy. It will introduce digital tools and methods used for the acquisition, transformation, analysis, and presentation of data. Coding is not required. Students completing the course will be able to integrate and apply the tools and methods into their research. Hands-on practices will be the major core of this course. Although students will expose to a wide range of tools, we use Konstanz Information Miner (KNIME), an open access analytics platform, as the axle of the course. Students will learn concepts and build workflows in different aspects of digital scholarship.

Ability to read Chinese, Japanese, or Korean documents is required. Contact the instructor for further detail.

FAS Divisional Distribution: Arts and Humanities

EASTD 143B (01)

Digital Tools and Methods in East Asian Humanities: Coding Approach

W 0900 AM - 1145 AM

Kwok-leong Tang

This course is designed for students in East Asian Humanities who are interested in adopting digital methods in their research with basic Python coding. It will introduce fundamental programming concepts, SQL and relational databases, popular Python libraries in data cleaning, text analysis, and supervised and unsupervised machine learning. Students completing the course will be able to integrate and apply the Python libraries taught in class into their research and to explore the rapidly growing newcomers without hurdles.

Ability to read Chinese, Japanese, or Korean documents is required. Contact the instructor for further detail.

EASTD 154 (01)

Threads: Histories and Theories of Clothing and Fashion

W 1200 PM - 0245 PM

Melissa M. McCormick, Chan Yong Bu

Course ID: 220091

2025 Fall (4 Credits)

Instructor Permission Required

This course focuses on fashion and clothing in Japan and Korea from pre-1900 to the present day. It aims to build a knowledge base of historically contextualized case studies through readings, lectures, and discussion. It examines clothing as a site of societal debate, personal and collective identity formation, and philosophical inquiry. Theoretical readings will allow students to apply what they learn to a variety of topics beyond East Asia for final papers and projects. Topics will engage with issues of gender, colonialism, and racialization in inter-Asian and internationalist contexts. Methods of analysis will include examining 1) the image of fashion and clothing (photographs, film, visual media, memory); 2) fashion as text, or written clothing—how clothing becomes fashion through discourse; and 3) the materiality of dress. To study materiality, the course includes a lab section where students will examine closely textiles and articles of clothing in the collections of the Harvard Museums, and engage in materials workshops (learning for example weaving and dyeing techniques). Students will be encouraged to make connections between form and function and meaning, and to incorporate a knowledge of technological constraint and possibility into their own analyses of clothing and fashion.

Course Note: This course will also include a one-hour Materials Lab.

This course counts for HAA concentration credit.

Each Lab section is capped at 12.

Political Parties of East Asia

2025 Fall (4 Credits)

T 1245 PM - 0245 PM

Daniel Koss

East Asia has been home to an astonishing assortment of political parties, covering the spectrum from democratic to authoritarian institutions, including some of the world's most sophisticated and resilient political organizations. We begin with China's Communist Party, revisiting its foundation in 1921, its rise during the Sino-Japanese War 1937-45, and its transformation from a revolutionary party to a party in power; then turn to the present day to cover the deep reach of the party into society, the activities and functions of ordinary members, as well as the dynamics of the leading echelons. The second part of the course focuses on Japan, including the origins of political parties in the late 19th century, the post-War emergence of the perennial ruling party, the age of grand money politics under Tanaka Kakuei, the electoral reform of 1993, and the origins of the party's current strength. The third part consists of case studies, covering contemporary parties in North and South Korea, parties in Taiwan before and after the democratic transition, as well as parties in Malaysia and Vietnam, with their multiple connections to East Asia. The course also puts East Asian parties into a comparative perspective to other world regions.

FAS Divisional Distribution: Social Sciences

EASTD 199 (01)

China and the African Continent

2026 Spring (4 Credits)

TR 1030 AM - 1145 AM

Daniel Koss

As Africa faces daunting challenges, the "Beijing model" invites intriguing alternative visions to the poorly performing designs by traditional foreign actors in the region. Moving from Chinese farm households in Mozambique to state-owned copper mines in Zambia, military bases in East Africa and the United Nations headquarters, this seminar critically assesses the potential for China's presence to transform Sub-Saharan Africa. After identifying the intellectual stakes (week 1), and discussing anecdotal glimpses from the grassroots-levels (week 2), the class deals with traditional development assistance, along with Maoist attempts to revolutionize the "world countryside" – resulting in legacies such as a China-trained guerilla fighter serving as the President of Zimbabwe. We then discuss the current footprint of Beijing, including its influence on elite politics, Chinese public and private business interests, and the diversity of the one million Chinese migrants to Africa. Four sessions specialize on (1) resource extraction versus opportunities for human capital development (2) debt-traps of Western and Eastern origins (3) emerging tensions over human rights policies (4) and the military dimension, including China's role in Peace-Keeping Operations. Finally, the course addressees how the Chinese presence may transform established multilateral institutions, and the challenges associated with African migration to China. Social science research will be read alongside journalistic accounts and primary documents, such as leaked diplomatic cables and strategy papers. Will Africa become "Beijing's Second Continent," of the neo-colonial or tributary kind? What promises does the China model hold for Africans? How do the partners on both continents react to experiences of disillusionment and retreat? The assignments are designed to train students for public policy work and require close group collaboration.

FAS Divisional Distribution: Social Sciences

Crisis? What crisis? This course examines the cultural, social, economic, and political transformations shaping religion and society in Japan. Rather than serving as a comprehensive survey, the course is divided into four thematic sections explored through ethnographic case studies and major conceptual themes. These include (1) the practices and processes of knowledge production (emic and etic perspectives, religion and modernity, colonial and postcolonial legacies), (2) religious landscapes (rural-urban spaces, religious tourism and heritage, economy and materiality, and environmental perspectives), (3) political entanglements (religion and law, nationalism, religious violence, religious pluralism, transnationalism, religion and ethnic and racial identities), and (4) questions of authority and agency through the prism of gender, technology, and the media. The emphasis throughout the course remains on the key concepts and debates in anthropology of religion.

This course will be taught by Paulina (Paula) Kolata.

A seminar focusing on primary sources in classical languages, as well as recent scholarship and theoretical texts. This semester, the course centers on medieval Japanese manuscripts in the collections of the Harvard Art Museums and Harvard University libraries. Students will decipher calligraphic writing (kuzushiji), translate classical Japanese literary texts, and analyze accompanying images in illustrated manuscripts. The course serves as a continuation of JPN106a: Classical Japanese.

FAS Divisional Distribution: Arts and Humanities

In this graduate seminar, students will explore the ways in which debates and negotiations about languages, writing systems, and linguistic and script diversity in East Asia matter in the formation and dispersal of imagined communities, establishment of and challenge to political power, social reproduction, and more. The course's wide-ranging readings are culled from diverse fields and disciplines including the history of writing, reading, and the book in East Asia (China, Japan, Korea, and Vietnam); linguistic anthropology; sociolinguistics; and studies of modernity/modernism and of colonialism and post colonialism. Examining the relationships between language, culture, and society in societies of East Asia in the past and the present, students will develop comparative (cross-regional, cross-temporal, and cross linguistic/script) and interdisciplinary approaches to the study of East Asia. This seminar is not a language or linguistics course. All readings are in English.

2025 Fall (2 Credits)

T 0300 PM - 0545 PM

Jie Li

This course is intended for graduate students in the Department of East Asian Languages and Civilizations, who are either first-time teachers or first-time teaching fellows (TF) in the department. While convened by the EALC PF, who will serve as a resource on weeks that are departmentally specific, invited experts trained in each week's topics will primarily run the course. It will begin by providing students with a tool-kit for effectively fulfilling their role as TF in the remote learning environment. This will include strategies for online teaching, managing and engaging students in the virtual classroom, and effective grading and feedback methods. The course will then transition into more specific topics that may arise in the classroom, and finally expand to consider broader issues that we all face when teaching in East Asian Studies departments. The course will meet for a total of 9 times. We will meet weekly for weeks 1-4 and bi-weekly for the remainder of the semester, in two-hour sessions. There are a total of 9 sessions, as well as the expectation that participants complete the Bok Center's self-paced Canvas site before the first course meeting. Students must successfully complete the course before advancing to their general exams. Each meeting will focus on a specific skill and is intended to give students the chance to not only think about how they want to teach, but also the opportunity to put those ideas into practice before stepping into the classroom. Beyond its specific weekly agendas, the course is intended to provide a comfortable space to voice concerns, discuss anxieties, identify fears, and share successes. Students are encouraged to raise issues about teaching and professional growth. The syllabus is flexible and can respond to student needs and concerns as the semester progresses, so please be sure to provide your feedback as we go along. The course is primarily intended for students currently in the fall semester of their G3 year, although G2 students are also welcome to enroll in the course. For G3 students, this is a chance to use actual materials from your assigned course to prepare for leading discussion sections in parallel with the demands of the semester. For G2 students, who will not yet have a teaching assignment, you will be asked to consult with your advisor about what course you are most likely to teach in the coming year, obtain a syllabus used in previous years for that course, and prepare for class activities based on those readings and potential lecture topics. Class requirements regarding collecting midterm feedback and class observation/recording may be completed during the following academic year without repeating the course.

This course will be taught by the DGS, who will be appointed in July.

Korean Literature in Translation

TR 1200 PM - 0115 PM

Si Nae Park

This lecture course introduces undergraduate students to selected works of Korean literature of all periods in translation, with an eye toward the broader humanistic study of Korean literature and culture. The class activities include deep reading, seminar-style discussion, research presentation, creative writing, and field trips.

Course Note: All readings are in English. No knowledge of the Korean language is required. Knowledge of Korean culture and history is not required but is encouraged. Graduate students may take this course for credit after consultation with the instructor. KORLIT 134 is a 100-level EALC course that can be counted toward fulfilling EAS concentration requirements. This year, Spring 2024, KORLIT 134 is offered as a bridge course of an advanced-level Korean language course, KOREAN 166R.

Chaghatay

CHAGATAY B

Elementary Chaghatay

MWF 1030 AM - 1145 AM

Course ID: 215859
2026 Spring (4 Credits)

This course is intended to develop a basic reading knowledge of Chaghatay, the classical antecedent of modern Uzbek and modern Uyghur, and the common literary language of all Central Asian Turks from the fourteenth to the early twentieth centuries. The course includes a survey of Chaghatay literature as well as a discussion of grammar, the writing system, and lexicographical resources; the class meetings will be devoted to both textbook-based instruction and (particularly in the second half of the semester) the reading of samples from Chaghatay texts drawn from printed sources and manuscript copies. This is a continuation of Chaghatay A.

CHAGATAY 120A

Intermediate Chaghatay

MWF 1030 AM - 1145 AM

Gulnar Yulghun

Course ID: 218156
2025 Fall (4 Credits)

A continuation of Chaghatay B. This course aims to develop learners' reading, transliterating, transcribing, and analyzing skills. Mainly focuses on reading the primary sources materials. These firsthand manuscript passages include selections from different time periods (fourteenth to early twentieth century), different places (both Eastern & Western Turkestan), and different genres (religious, historical, literature, legal, healing and medical etc.). This will provide learners with an excellent basis as they move forward with their own research. In this course learners will be able to (1) read original handwritten Chaghatay materials; (2) distinguish different genres; (3) transliterate and transcribe manuscripts, as well as practicing linguistic annotation and translation into English; and (4) analyze each reading materials.

JAPNLIT 261 (01)Course ID: 220044
2025 Fall (4 Credits)**Authorship and Literary Creativity in Early Modern Japan**

R 1245 PM - 0245 PM

David Atherton

This course explores the nature of authorship and the imagination of literary creativity during Japan's Edo period (1600-1868). Did poets, playwrights, and commercial writers understand "writing" as something shared among their diverse creative endeavors? To what extent did the theorization of different literary arts involve a shared conceptual vocabulary? How should we understand the gaps between writerly theory and practice? How did literary identities intersect status identities? Did models of creativity from earlier periods shape early modern conceptions of authorship? Can we trace the role of readers and fans in the shaping the figure of the author? How should we understand the striking gender segregation apparent in early modern authorship? We will examine poetic treatises, author biographies, playwrighting manuals, works of fiction, visual representations of writers past and present, encyclopedias and theatrical ephemera, letters, and works of social history concerning status, selfhood, and labor. We will also read select works of literary theory from the classical and medieval periods. Students will gain experience in reading a wide variety of early modern registers and styles will develop a comprehensive grasp of early modern poetic, prose, and theatrical literary production across a broad range of genres.

Ability to read classical Japanese.

FAS Divisional Distribution: Arts and Humanities

JAPNLIT 262 (01)Course ID: 226316
2026 Spring (4 Credits)**Theater and Theatrical Culture in Early Modern Japan**

R 0300 PM - 0545 PM

David Atherton

The Edo period witnessed the rise of two major theatrical forms—jōruri (puppet theater) and kabuki—that would exert an enormous impact on early modern culture. Both remain living performance genres today. Yet studying them as forms of early modern theater proves daunting. Both forms have undergone significant changes since the end of the Edo period (as, indeed, they transformed across the centuries of Tokugawa rule). And because performance is, by nature, ephemeral, reconstructing the dynamics and experience of an early modern play presents significant challenges. This is particularly true in the case of kabuki: a form for which the script (few of which survive) served primarily as a general outline for performances that could change significantly from one showing to the next. Yet both theaters left a wide range of traces in diverse media: playbills, actor critiques, actor and theater prints, objects, book illustrations, and theater-related books of all varieties, from satirical "audience critiques" to adaptations of plays into illustrated print fiction (kusazōshi). This seminar has three aims. First, it will introduce students to practical methods for studying early modern performance: familiarizing them with archives of theatrical ephemera, introducing strategies for accessing elements of performance from secondary materials, studying accounts of playwriting and performance by early modern playwrights and actors, and weighing the pitfalls and rewards of relying upon the conventions of modern performances. Second, it will invite students to understand early modern "theater" not only as a matter of performance, but as a broader cultural phenomenon that most people accessed not within the playhouse, but through secondary media like playbills, prints, critiques, merchandise, and fiction. And third, the seminar will delve into broader cultural, social, and political dimensions of theater in the early modern period, touching on such subjects as the relationship between the theater and the sacred; the theater's relationship to early modern discourses of emotion; the body of the actor and the performance of gender; fan culture; the relationship between urban and rural theatrical culture; and the ongoing debate about whether early modern kabuki is better understood as a subversive or a conservative genre. Our learning will take place not only in the classroom, but also through visits to the Harvard Art Museums and the Yenching Rare Book Room.

Ability to read modern and classical Japanese.

History of Modern Korea

F 1200 PM - 0245 PM

Sun Joo Kim

The purpose of this class is to examine the strong and weak points of Korea's modern history (roughly 1850—1987). The format will be lecture and discussion based on a series of questions. Did Korea adequately prepare itself to fend off Japan and other potential colonizers up through 1910? Where could it have done better? Then, it will evaluate Japan's time as administrators of the Peninsula and its people. Where do its faults/strengths lie? Finally, our examination will conclude with an examination of the post-liberation period and question some of the decisions made by its leaders leading up to the democratization movement.

This course will be taught by Mark E. Caprio, professor emeritus at Rikkyo University in Tokyo, Japan. <https://ealc.fas.harvard.edu/people/mark-caprio>

JAPAN 106A

Classical Japanese

TR 1030 AM - 1145 AM

Danica Truscott

In this course, we will learn and practice reading the fundamental grammatical patterns of classical, or literary, Japanese (bungo). From Murasaki Shikibu's *The Tale of Genji* to Bashō's famous haiku, this linguistic form appears in a wide variety of Japanese literature. In fact, traces of classical Japanese can still be found in modern Japanese and are often employed in news articles and song lyrics. As we read poetry, short stories, diaries, and more, students will not only gain the ability to read premodern vernacular texts with the aid of a dictionary, but will also develop a deeper appreciation for Japanese language and culture across the ages.

Japanese 130b or with instructor's permission.

JAPAN 106B (01)

Introduction to Kambun

TR 1030 AM - 1145 AM

Danica Truscott

In this course, students will learn how to read a variety of Japanese texts written entirely in Chinese characters, or kambun. Specifically, we will practice the art of rendering both classical and quasi-classical Chinese script into Japanese syntax, a reading method known as kundoku or yomikudashi. After learning the basics via textbook, we will read texts from several different genres such as mythologies, histories, and official documents. By taking

Course ID: 111790
2026 Spring (4 Credits)

this course, students will begin developing the necessary skills for reading primary sources produced by Japanese officials and literati with the aid of a dictionary, laying the groundwork for further training in students' specific fields of research.

FAS: Meets Foreign Lang Req: Kambun

JAPAN 106C (01)

Later Classical Japanese

TR 1200 PM - 0115 PM

Danica Truscott

This course is a continuation of Japan 106A as we further practice reading and translating texts written in classical Japanese. Specifically, we look at works written in the writing style of the vernacular, also known as kana. Such texts include poetry, monogatari tales, and personal diaries. Our schedule will be organized into various units by format and genre as well as students' interests. As we read, we will situate these texts within their historical and social context, while also exploring what these texts tell us about their historical moment. Students will submit a working English-language translation for a text of their choosing as a final project, thereby demonstrating a nuanced understanding of premodern vernacular Japanese texts along with the societies that produced such works.

JAPAN 106D (01)

Kana and Kanbun Texts in Early and Classical Japan

T 1245 PM - 0245 PM

Danica Truscott

Educated classes in premodern Japan read and often wrote utilizing both kana ("vernacular") and kanbun ("Chinese") writing systems in recording their lives and creating art. Following in their footsteps, students will read and translate texts written in both kana and kanbun from Japan's early and classical periods (710-1185). We will explore differences in form and content between the two writing styles along with linguistic quirks featured in our readings. We will also consider the conception of gendered writing and cross-cultural comparisons with other East Asian literatures, including poetic treatises and histories. At the end of this course, students will be able to not only read and translate texts written in multiple linguistic forms, but also discuss such texts side-by-side in a comprehensive manner.

Topics in Japanese Cultural History--Toward a History of the Here and Now

F 1200 PM - 0245 PM

Course ID: 120567
2026 Spring (4 Credits)

Shigehisa Kuriyama

The seminar this spring will center on the historical phenomenology of place and time. Specifically, our main concern will be this: How might one study, historically, the experience of the here and now? That the sense of the local "here" and the present "now" has varied over the course of history seems obvious. But in exactly what ways has this sense varied—and why? And most critically: what sorts of sources and interpretive frames might allow us to articulate and understand this variation? Our case studies will draw on a wide range of sources in Japanese cultural history spanning from the late classical period to the digital present. About half of our meetings, however, will be devoted to discussing theoretical writings about the study of place and time. While the greater part of the assigned readings will be in English, participants should also be prepared for some readings in modern Japanese.

Topic for Spring 2026: The Universe of Food.

*Advanced reading knowledge of Japanese with some acquaintance with (or at least concurrent study of) **bungo** and **kambun**.*

Economics

Economics

ECON 10A

Principles of Economics (Microeconomics)

MW 1030 AM - 1145 AM

Jason Furman, David Laibson

Course ID: 113326

2025 Fall (4 Credits)

Economists study human behavior using a combination of models and data. Ec10a introduces students to economic models using intuitive discussions, graphical analysis, and, in some cases, basic algebra. The models study individual decision-making and markets, and range from classical approaches like supply and demand to more recent approaches that consider informational limitations and behavioral mistakes. We will also use data to understand the strengths and weaknesses of these models. The course also discusses the role that ethics and values play in people's choices and in policy discussions, including an understanding and critique of approaches like utilitarianism, Rawlsian principles of justice, and libertarianism. The goal of the course is to provide students with a set of tools that will help them develop answers for themselves on how to make better choices and participate in debates on major public policy issues in areas including tax policy, inequality, discrimination and racial justice, and the environment.

Course Note: Ec10a is the first half of an integrated sequence that continues with the study of macroeconomics in Ec10b. Students may elect to take only the microeconomics course and receive four credits. This sequence is designed with two types of students in mind. For students who will never take another economics course, Ec10a and Ec10b provide a self-contained training to prepare them to understand and engage with economic issues. For students who end up concentrating in economics, Ec10a and Ec10b provide a wide-ranging introduction to the field and are required courses. The Department of Economics strongly encourages students considering concentrating in economics to take these courses during their first year at the College. Ec10a and Ec10b are not duplicative of AP Economics courses but aim to provide a broader perspective and a deeper engagement with public policy and current developments in the field of economics (e.g., behavioral economics). Either Ec10a or Ec10b fulfills the Social Sciences divisional distribution requirement. It is not necessary for students to take both halves of Ec10 to fulfill this divisional requirement.

There is no mathematics background requirement. No calculus is used in the course and the use of algebra is limited. Ec10a is strongly recommended in advance of Ec10b, which covers macroeconomics.

For students who will never take another economics course, Ec10a

and Ec10b provide a self-contained training to prepare them to understand and engage with economic issues. For students who end up concentrating in economics, Ec10a and Ec10b provide a wide-ranging introduction to the field and are required courses. The Department of Economics strongly encourages students considering concentrating in economics to take these courses during their first year at the College. Ec10a and Ec10b are not duplicative of AP Economics courses but aim to provide a broader perspective and a deeper engagement with public policy and current developments in the field of economics (e.g., behavioral economics). Either Ec10a or Ec10b fulfills the Social Sciences divisional distribution requirement. It is not necessary for students to take both halves of Ec10 to fulfill this divisional requirement.

There is no mathematics background requirement. No calculus is used in the course and the use of algebra is limited. Ec10a is strongly recommended in advance of Ec10b, which covers macroeconomics.

ECON 10B

Principles of Economics (Macroeconomics)

TR 0300 PM - 0415 PM

Andrés Maggi

Course ID: 109894
2025 Fall (4 Credits)

Instructor Permission Required

Ec 10b continues the curriculum presented in Ec 10a, moving to the study of macroeconomics including the growth of the overall economy, business cycles, and economic crises. Ec 10b explains what economists do and do not understand about these issues by developing analytical approaches and examining data, including studying the global financial crisis and the economic crisis caused by COVID-19. The course also explains how policy makers can dampen economic fluctuations using monetary policy (i.e., government influence over interest rates and government regulation of banks), fiscal policy (e.g., government control of spending and taxation), and financial rescues in economic crises. We will also discuss how macroeconomic policies work in an international context, including the factors that affect exchange rates, trade deficits, international capital flows, and how these link economies around the world. Like Ec 10a, Ec 10b introduces students to economic models and discusses both how they are supported and how they are contradicted by available data.

Course Note: Ec 10b is the second half of an integrated sequence that begins with the study of microeconomics in Ec 10a. Students may elect to take only the fall microeconomics course and receive four credits. This sequence is designed with two types of students in mind. For students who will never take another economics course, Ec 10a and 10b provide a self-contained training to prepare them to understand and engage with economic issues. For students who end up deciding to be Economics Concentrators, Ec 10a and 10b provide a wide-ranging introduction to the field and are required courses. The Department of Economics strongly encourages students considering concentrating in Economics to take these courses during their first year in the college. Ec 10a and 10b are not duplicative of AP Economics courses but aim to provide a broader perspective and a deeper engagement with public policy. Ec 10a or 10b fulfill the Social Sciences distribution requirement for the General Education program. It is not necessary for students to take both halves of Ec 10 to fulfill this requirement.

There is no mathematics background requirement. No calculus is used in the course and the use of algebra is very limited. Taking Ec 10a which covers microeconomics and is taught in the Fall is strongly encouraged but is not a formal prerequisite.

Using Big Data to Solve Economic and Social Problems

MW 0130 PM - 0245 PM

Nadarajan Chetty, Gregory Bruich

This course will show how "big data" can be used to understand and address some of the most important social and economic problems of our time. The course will give students an introduction to frontier research and policy applications in economics and social science in a non-technical manner that does not require prior coursework in Economics or Statistics, making it suitable both for students exploring Economics for the first time and more advanced students. Topics include equality of opportunity, education, innovation and entrepreneurship, health care, climate change, and crime. In the context of these topics, the course will also provide an introduction to basic methods in data science, including regression, causal inference, and machine learning. The course will include discussions with leading practitioners who use big data in real-world applications.

Personal Finance: Making Better Decisions and Building a Better Financial System

TR 0130 PM - 0245 PM

John Campbell

People face a daunting array of problems in managing their financial lives. Taking out student loans, managing bank accounts and credit cards, financing a home purchase with a mortgage, and saving for retirement are all major challenges. There is evidence that many people lack the skills they need to meet these challenges. This course has three goals. The first objective is to give participants a basic grounding in financial literacy: principles of finance that we can use in our own lives. The second objective is to introduce research on the ways in which households use the financial system, emphasizing common financial mistakes and financial products that seem prone to misuse. We will learn to read papers from the academic economics literature, focusing on the papers' central ideas and empirical findings. The third objective is to explore ways in which the financial system can be improved to make it easier and safer to use. We will discuss the role of financial advisers, technological solutions ("fintech"), and public policy interventions including disclosures, default choices ("nudges"), and regulations restricting access to financial products. The course has no prerequisites.

The Past, Present and Future of Globalization

W 0945 AM - 1145 AM

Instructor Permission Required

Pol Antras

This course will overview recent trends in the world income distribution and will discuss economic research aimed at understanding the role of globalization (trade integration, multinational activity, etc) in shaping these trends. The course will also overview a recent body of work seeking to understand how geopolitical forces shapes the global economy. The course will focus on analytical and statistical methods and therefore requires knowledge of calculus and econometrics. We will use microeconomic tools extensively, and thus having taken Economics 1010a or 1011a is a pre-requisite for the course. I would also recommend having taken Economics 1535 (International Trade and Investment), but it is not a formal pre-requisite of the course.

Ariel Pakes

The course will focus on policy options in health care. We will read papers on the impacts of moral hazard and adverse selection in health care markets and how they interact with various policies (co-pays, co-insurance, capitation vs fee for service payments, ...). We will consider the impact of horizontal mergers both among health care providers and among insurance companies, as well as vertical mergers between providers and insurers. We will also look at pharmaceutical research and development and the distribution of costs and benefits from that. Students will lead the discussion on the various readings. techniques will be taught during the course). This is a Junior Tutorial.

Course Note: This course requires special action- application or lottery- to enroll. Visit economics.harvard.edu/page/junior-seminar-0 and the course canvas site for more information.

Economic Growth and the Social Issues of Our Time

MW 1030 AM - 1145 AM

Instructor Permission Required

Benjamin Friedman

Economic improvement is more than just a matter of economics. The course explores where economic growth comes from, how it matters in material ways and what indirect consequences – some positive, others negative – it brings for citizens individually and for society. The course also examines the role of education, both in enhancing an economy's growth potential and in either mitigating or exacerbating social inequalities. Approaches taken are mostly economic but also historical and philosophical.

Economics 10 is required in order to take this course.

Using Markets to Solve Social Problems

M 0300 PM - 0545 PM

Roland Fryer

This course will demonstrate how one can use the power of the free market to address some of the most vexing social and economic problems of our time, with a particular emphasis on issues that plague minority communities and women. The course will give students an introduction to social finance and impact investing in a manner that does not require prior coursework in Economics. It is intended not only for those interested in finance or social justice, but also for students with a disruptor spirit. Students will study situations in which market-based approaches were used to solve problems in areas such as education, discrimination, economic mobility, crime, healthcare, food instability, and the future of work. In the context of these topics, the course will provide an introduction to basic principles in finance and for-profit enterprises, venture capital, and other alternative investment strategies. The course will include discussions with leading investors and entrepreneurs who are determined to have positive social impact and culminates in a team-based capstone project in which you build your own startup to take on an important social issue and demonstrate its commercial viability.

Strategy, Conflict, and Cooperation

TR 0300 PM - 0415 PM

Robert Neugeboren

Course ID: 123893
2026 Spring (4 Credits)

Game theory is the study of interdependent decision-making. In the early days of the cold war, game theory was used to analyze an emerging nuclear arms race; today, it has applications in economics, psychology, politics, the law and other fields. In this course, we will explore the "strategic way of thinking" as developed by game theorists over the past sixty years. Special attention will be paid to the move from zero-sum to nonzero-sum game theory. Students will learn the basic solution concepts of game theory -- including minimax and Nash equilibrium -- by playing and analyzing games in class, and then we will take up some game-theoretic applications in negotiation settings: the strategic use of threats, bluffs and promises. We will also study the repeated prisoner's dilemma and investigate how cooperative behavior may emerge in a population of rational egoists. This problematic -- "the evolution of cooperation" -- extends from economics and political science to biology and artificial intelligence, and it presents a host of interesting challenges for both theoretical and applied research. Finally, we will consider the changing context for the development of game theory today, in particular, the need to achieve international cooperation on economic and environmental issues. The course has two main objective: to introduce students to the fundamental problems and solution concepts of noncooperative game theory; and to provide an historical perspective on its development, from the analysis of military conflicts to contemporary applications in economics and other fields. No special mathematical preparation is required.

Game Theory with Applications to Social Behavior

TR 0900 AM - 1015 AM

Erez Yoeli, Moshe Hoffman

Course ID: 203555
2025 Fall (4 Credits)

Instructor Permission Required

Game theory is the formal toolkit for analyzing situations in which payoffs depend not only on your actions (say, which TV series you watch), but also others' (whether your friends are watching the same show). You've probably already heard of some famous games, like the prisoners' dilemma and the costly signaling game. We'll teach you to solve games like these, and more, using tools like Nash equilibrium, subgame perfection, Bayesian Nash equilibrium, and the one-shot deviation principle. Game theory has traditionally been applied to understand the behavior of highly deliberate agents, like heads of state, firms in an oligopoly, or participants in an auction. However, we'll apply game theory to social behavior typically considered the realm of psychologists and philosophers, such as why we speak indirectly, in what sense beauty is socially constructed, and where our moral intuitions come from. Each week, students are expected to complete a problem set, to read 2-3 academic papers, and to complete a 1-2 page response to short essay questions ('prompts') on these readings. All assignments can be completed in groups of two. Tutorials are not required but are highly recommended for students without a substantial background, especially in math. There will also be a final exam.

ECON 1088

Finance for Inclusive Growth

MW 0130 PM - 0245 PM

Emily Breza

Course ID: 213522
2025 Fall (4 Credits)

Over the past decade, access to financial services has expanded by 50%, yet a quarter of adults globally still do not have access to a formal financial account. Why has it been so challenging to reach this population? What financial product innovations have worked for banking poor customers? How do the underbanked make do without access to the formal financial market? What opportunities and challenges are presented by the global rise of digital payments and fintech? This course investigates the functioning of the financial market for low-income populations, with a focus on developing countries. Example topics include: 1) the link between financial market development and economic growth; 2) financial literacy and consumer protection; 3) savings and credit; 4) mobile banking and digital payments; 5) fintec. The course will cover relevant economic principles, business case studies, product design experiments, and research papers.

ECON 1133Course ID: 219753
2026 Spring (4 Credits)**Authoritarian Superpower: The Political Economy of Modern China***No meeting time listed*

David Yang

The rise of China is undoubtedly one of the great dramas of the 21st century. This course provides an overview of China's economy and its politics, as well as China's relationship with the world. We aim to understand modern China with an appreciation of China's past and its connection to other parts of the globe. The course offers insights on a number of puzzles of a rising authoritarian superpower, and overturns several conventional wisdoms in political economy. In the course, you will learn about topics such as: (1) What drives China's economic development? What explains its rise? (2) What are the key forces of stability and forces of change in modern China? (3) How does China engage with the world, and what are the implications of China's rise for the world? The objectives of the course are three-fold: (1) to learn about important institutional and contextual knowledge of China; (2) to use China as a lens to understand authoritarian regimes, as well as basic political economy frameworks that are more generally applicable; and (3) to learn about empirical methods through exposure to big data on China, frontier academic research, and occasionally case-study style discussions.

FAS Divisional Distribution: Social Sciences

Economics of Mental Health and Homelessness

M 0345 PM - 0545 PM

Matthew Basilio

How does society influence mental health? How does mental health influence the economy? How do economic theory and econometrics illuminate, and obfuscate, the challenges of mental illness? Mental health has quickly become one of the most important topics in global policymaking. Yet the links between influential fields of social science – especially economics – and behavioral medicine remain underdeveloped. This course will first explore the frontier of concepts in psychopathology, including perspectives from rational choice theory which are both limiting and illuminating in the ongoing quest to characterize mental health and mental illness. The course will then turn to the social and economic drivers of mental health. From deaths of despair and the U.S. opioid epidemic, conspicuous consumption and income-wellbeing relationship, social media and American teen distress, and our general state of misery despite unprecedented material affluence, this course will systematically investigate the influences of society on mental health. Unlike most courses on mental health in other departments or medical schools, the syllabus will uncover unique empirical insights produced by the field of economics, and review in detail the econometric techniques used in these studies. Third, we will turn to the influences of mental health on society. We will consider extreme outcomes in housing markets such as homelessness and its relationship to severe mental illness. We examine classical approaches in economics to the housing market and homelessness, including new insights from behavioral health and transnational perspectives. Finally, we will turn to the roll of interventions. From pharmacotherapy, new interventional techniques (ECT, rTMS, ketamine), therapy, nutrition, and health system organization, ACT teams, supportive housing, we will consider potential and limitations in current societal responses to mental illness, using cross-national comparisons to illuminate the important differences in outcomes. We end with a consideration of the goals of economic policy, and examine how a focus on enhancing human mental wellbeing may offer unique opportunities in climate change and growth policy.

Course Prerequisites: Introductory Micro (Ec 10a), Statistics (Stat 100/104/110 or equivalent) and Calculus (Math 1a or equivalent) are prerequisites for the class, or permission of the instructor.

Requires: Introductory Micro (Ec 10a), Statistics (Stat 100/104/110 or equivalent) and Calculus (Math 19a, 21a or equivalent)

FAS Divisional Distribution: Social Sciences

The History of Economic Growth

This course examines the history of economic growth, beginning with the divergence between human ancestors and other primates and continuing through the end of the 20th century. Topics covered include the Neolithic Revolution; economic growth in ancient societies; the origins of modern economic growth; theories and evidence about the institutional, geographic, and cultural determinants of growth; the East Asian Miracle; the middle income trap; the political economy of growth; growth and inequality; and theories and evidence about the persistence of poverty in the world's poorest regions. Prerequisite: Economics 1010a (1011a)

FAS Divisional Distribution: Social Sciences

The Economics of Development and Global Health

M 0645 PM - 0845 PM

Matthew Basilio

Why are some places poorer than others? Why do some places have better health than others? In this class, we will harness the core development and health economics literature to approach some of the most fundamental questions facing humanity today. We will review the historical determinants of our present-day puzzles, including critical relationships between economic development and health. We will consider challenges affecting health and development including political institutions, micro development, environmental change, and psychological wellbeing. Methodologically, the course will review canonical approaches in applied econometrics, and will cover theories in development, macro-growth, and health. It will also consider perspectives on our core questions from neighboring disciplines, including social theory, anthropology and psychology.

Course Note: A research paper option is available for this class which can be used to fulfill the writing requirement for Economics concentrators.

Economics 10a and 10b, familiarity with introductory statistics (e.g. Stat 100, 104 or 110), and calculus are recommended but not required.

Public Economics: Designing Government Policy

R 0900 AM - 1145 AM

Stan Veuger

This course analyzes what role the government plays and should play in a market economy. It covers topics such as tax policy, health care policy, retirement policy, environmental protection, and state and local policy. The course emphasizes recent empirical research on policy issues and teaches students how to conduct such studies. Much of the material we will cover relates directly to ongoing policy debates. After an introduction to some of the key theoretical concepts and empirical methods in public economics, we will consider how the public sector in the United States (and in advanced, democratic economies more generally) is organized. We will look at how it raises revenue; what it allocates resources to; and how it uses regulations to shape economic activity. We conclude by analyzing how to deploy these policy instruments—taxation, spending, and regulation—in three specific areas: climate policy, trade policy, and income redistribution.

Course Note: Offered jointly with Kennedy School as SUP-125.

Familiarity with intermediate microeconomics, multivariate calculus, and econometrics (at the level of economics 1123 or 1126) is strongly recommended.

MW 1030 AM - 1145 AM

Augustin Bergeron

In this class, we will study some of the key theoretical ideas for how politics affect economic development. We will also look at various empirical examples drawn from the developing world. Topics include the historical determinants of development, conflict, voting, media, the political economy of social protection, the political economy of taxation, and corruption. By the end of the course, students are expected to (1) have acquired a foundation for thinking critically about the role of political economy in understanding economic development; (2) demonstrate an understanding of the core theoretical concepts in political economy, and be able to support them with illustrations from developing countries; (3) understand empirical evidence in economics, including what makes a good empirical study and what empirical techniques can be used to understand the world better.

Course Note: Students who are currently taking one or both of the pre-requisite classes and are interested in

enrolling should contact Professor Bergeron before registering.

Requires: Pre-requisite: (ECON 1010A or ECON 1011A) AND (ECON 1123 or ECON 1126)

Macroeconomic Stabilization Policies

R 0300 PM - 0500 PM

Paul Tucker, Lawrence H. Summers

Course ID: 217408

2025 Fall (4 Credits)

Instructor Permission Required

With real interest rates negative for nearly a decade and nominal interest rates close to zero, and fiscal deficits and debt-to-GDP ratios at unprecedented levels, we are in a new era for macroeconomic policy making. This seminar course will focus on macroeconomic policy issues posed by secularly low real interest rates (secular stagnation?), COVID-19, and government debt accumulation. The focus will be on the application of rigorous macroeconomic analysis to policymaking. The objective of the class is to expose students to the kind of thinking and work done by practicing macroeconomists. The centerpiece of the class will be student research papers, 25- to 30-pages, on macroeconomic topics, developing, applying, or testing relevant economic theory. Students will work closely with one of the course instructors and an economics PhD student on their papers. During seminar meetings, students will present and lead discussions of major recent research papers, and present their ongoing work. Examples of topic areas for papers might include: The role of risk premiums vs. savings-investment gaps in explaining interest rate fluctuations; the influence of social insurance on aggregate demand; Ricardian equivalence and the impact of fiscal policy in raising long run demand; the implications of low rates for target returns on institutional portfolios, financial stability, and creative destruction; saving gluts and current account surpluses; the risks of destabilizing deflation; and lessons from the Japanese experience.

ECON 1535

The Global Economy

MW 0130 PM - 0245 PM

Pol Antras

Course ID: 111749

2025 Fall (4 Credits)

A wave of protectionism has rocked the world economy in recent years. In the United States, the Trump administration abandoned the country's traditional position as a defender of international trade, viewing global trade as a "zero-sum" game in which only some countries benefit at the expense of others. In the UK, the consequences of voting for Brexit are not yet entirely clear, but free access to the European market that guaranteed membership of the European Union is no longer possible. Contemporaneously, there has been an active debate on the extent to which geopolitical tensions (such as the increasing tensions between Russia and the West) and technological change (automation, 3D-printing, etc) might work to reduce the level of trade integration across countries. What would be the economic consequences of the increase in protectionism and of technologically driven "de-globalization" around the world? The purpose of this course is to review in an accessible and concise manner the causes and consequences of globalization and of (potential) "de-globalization" episodes. In the first lectures, the concept of "globalization" will be defined and an overview of the benefits and costs associated with trade integration will be offered. The course will highlight the role of firms, and of multinational firms more specifically, in shaping global production and consumption patterns. A few lectures will be devoted to the economics and politics of trade policy.

ECON 1644

Market Power in the New Economy

MW 1200 PM - 0115 PM

Myrto Kalouptsi

Course ID: 217793

2026 Spring (4 Credits)

This course studies firms, markets and competition, in the context of today's (globalized) world. Nowadays, in the majority of markets, a handful of firms interact strategically and compete in numerous dimensions, including prices, products offered, advertising and investment. We will use formal models in order to address questions like: Why are markets organized the way they are? How does market organization affect firm behavior, such as firm production or pricing? How does the behavior of firms in turn affect the market structure? How does government policy shape firm behavior and market structure? What is the impact on welfare? Through the use of both theory and data, we will attempt to answer these questions. The course will proceed in three parts. We will first tackle decentralized markets; i.e. markets where many small firms compete in an ad hoc fashion (e.g. taxis, oceanic shipping, real estate). A recent and growing phenomenon in this setup is the emergence of platforms, such as Uber and Lyft, Uber Freight, Airbnb, etc. We will discuss their impact on markets and societal welfare. Then, we will introduce key concepts from the field of Industrial Organization in order to study oligopolistic markets. Through the use of models (mainly game theory) but also empirical analysis, we will explore the strategic interactions between firms and the impact of market power on society. Using these tools, we will study collusion and mergers. We will rely on game theory to analyze the strategic environment under study. Finally, we will study market power in global markets. In a strong recent trend, governments around the world are engaging in industrial policy (e.g. Made in China 2025). What are the rationales behind these initiatives? Are they effective? What is their impact on both domestic and global societal welfare? In this last part of the course we will focus on the role of governments in shaping global competition. The goal of this class is to get you engaged in topics of current interest and heated policy debates; "what is market power and how does it affect the world?", "how has uber changed transportation?", "does industrial policy work?" but also to get you to think about these questions through the rigorous lens of an economist armed with a good combination of formal modeling and empirical tools.

Financial and Economic Crises of the 21st Century

Course ID: 207618
2026 Spring (4 Credits)

MW 0130 PM - 0245 PM

Karen Dynan

This course examines major financial and economic developments that have challenged the U.S. economy over the past two decades. We begin with the 2007–2009 global financial crisis, studying the role of the mortgage boom and bust, the mechanisms through which problems spread to the broader financial system, and why the crisis proved so devastating for the economy. We will discuss the policies implemented to stabilize the financial system and the subsequent financial reforms. The course then turns to more recent financial and economic disruptions, including those associated with the onset of the COVID-19 recession, the post-pandemic surge in inflation, mounting federal debt, and other emerging threats to financial and economic stability. We will evaluate the policy responses to these developments and consider their implications for the future.

The Economics of Cities

Course ID: 111292
2026 Spring (4 Credits)

TR 1030 AM - 1145 AM

Denise DiPasquale, Edward Glaeser

Why are some cities so much more successful than others? What policies can turn places of poverty into places of opportunity? In this course, we explore our urban world using the tools of economics. Topics include firm and household location decisions, land use regulation, housing markets, transportation and entrepreneurship and innovation. We particularly focus on issues related to high housing costs, poverty, crime, the transformational role of cities in the developing world, and the future of cities in the age of Zoom and climate change.

Social Analysis 10 and Statistics 100.

FAS Divisional Distribution: Social Sciences

Economics of Discontinuous Change

TR 0130 PM - 0245 PM

Richard Freeman

Explores discontinuous changes and differences in socio-economic outcomes among countries, firms, and people, with attention to the four "apocalyptic" shocks that upended human lives in recent years; the Covid19 pandemic, 2008 implosion of Wall Street, Climate Change embodied in extreme weather events; and wars per Russian invasion of Ukraine; and on the possible role of "fifth horseman" of AI in helping solve these problems vs creating a new danger; and on shocks affecting academic lives: rise of student-employee unionism; student protests; and changes in knowledge and scientific ideas. Course examines mathematical models, computer simulations, and empirical evidence on growth of social movements such as trade unions, homophily and segregation of groups, power laws in inequality, spread of ideas, where change is driven by positive feedback loops instead of the workings of markets that equilibrate through negative feedbacks. Models include neural networks, finite automata, evolutionary stable strategies, and agent-based AI simulations. Lots of attention on how to get evidence on key parameters in these models from big data to case studies to lab experiments. Key requirement is an independent research paper on one of the discontinuous shocks.

Course Note: Course grades depend largely on independent research project/paper. Professor and TF will provide guidance on topic, help in obtaining data, information from firms, etc. This course meets the concentration writing requirement, if the project is a substantive, solo-authored, original research work (not a literature review). Students should have some mathematical background, but there is no prerequisite.

FAS Divisional Distribution: Social Sciences

ECON 1936Course ID: 107388
2025 Fall (4 Credits)**Keynes**

TR 0300 PM - 0530 PM

Stephen Marglin

This course explores the birth, death, and resurrection of The General Theory of Employment, Interest and Money from the Great Depression (1929-1939) to the Great Recession (2008-?). A major goal is to lay out a coherent argument that, for all its theoretical innovation, The General Theory did not deliver: the argument why a market system, even an idealized system with all of the warts removed, may fail to provide jobs for willing workers. In the process we will examine the orthodoxy that Keynes attacked and that resurfaced in the 1960s and 70s; the key concepts underlying the models implicit in The General Theory; and the attempts of the Keynesian mainstream to make peace with both Keynes and orthodoxy. We will also explore the applicability of The General Theory to the long run. A final section will view the present economic difficulties through a Keynesian lens.

Economics 1010b or 1011b, or permission of instructor; a year of college calculus allowing students to understand mathematical notation and concepts (derivatives, maximization, etc.) even though mathematics will be used very sparingly.

ECON 2000Course ID: 113716
2025 Fall (4 Credits)**Introduction to Quantitative Economics**

TR 0900 AM - 1015 AM

*Instructor Permission Required**Jesse Shapiro, Jeffrey A. Miron*

Quantitative economics is the use of economic models to interpret data. The course proceeds through a series of economic settings, each of which motivates a canonical economic model. Readings and ungraded written reflections guide students through core concepts. Graded written work includes both pen-and-paper exercises designed to extend concepts and data exercises designed to apply them. Classroom discussion focuses on reviewing concepts, reflections, and exercises in parallel with students' reading and written work. At the end of the course, students are prepared to begin using economic theory to interpret data. They are also prepared to continue the study of quantitative economics within particular subfields, where they may encounter more elaborate or specialized economic models, and more complex data structures. The course requires microeconomics at the level of Economics 2010a/b and econometrics at the level of Economics 2120 or 2140.

Computing for Economists	2025 Fall (4 Credits)
TR 0130 PM - 0229 PM	<i>Instructor Permission Required</i>
Jesse Shapiro, Jeffrey A. Miron	

Computing for Economists is a month-long course introducing concepts in software engineering and scientific computing that are essential for modern economics research. Concepts will be introduced via videos that students will watch in advance of class sessions. Class sessions will be devoted to supervised group work on exercises. Students can choose six out of twelve modules, including topics in software engineering (e.g., object-oriented programming, metaprogramming, parallelization, computational complexity), scientific computing (e.g., non-linear equation-solving, numerical optimization, integration, differentiation), data manipulation (e.g., data normalization, large-scale data handling, data visualization), and some other advanced topics (e.g. combinatorial optimization). The course is designed to accommodate students with all levels of programming background, providing a flexible and practical approach to applying computational tools in economics. The course is based in Python, but will convey computational concepts that are portable across programming languages. Class sessions will be synchronous and will feature both in-person and remote options.

ECON 2049

Topics in Mechanism and Market Design

W 0300 PM - 0545 PM

Course ID: 226859
2026 Spring (4 Credits)

This is a course in mechanism and market design covering methods, classical and modern theoretical results, applications, and possibly also related experimental work. Topics will include Bayesian, dominant-strategy and ex-post incentive compatibility, optimal and efficient auctions (the general independent private value case and beyond), topics in extensive-form mechanism design (with a focus on simplicity and credibility), matching mechanisms, and topics in robust mechanism design. Additional topics may be added depending on student interest and time permitting. Prerequisites: Microeconomic theory at the level of the first-year PhD sequence.

Course Note: Prerequisites: Microeconomic theory at the level of the first-year PhD sequence.

ECON 2059

Decision Theory

W 0900 AM - 1145 AM

Tomasz Strzalecki

Course ID: 121331
2025 Fall (4 Credits)

This course prepares students for pure and applied research in axiomatic decision theory. We start with a rigorous treatment of the classical topics that are at the heart of all of economics (utility maximization, expected utility, discounted utility, Bayesian updating, dynamic consistency, option value). We then delve into a number of modern topics inspired by the observed violations of the classical models ("exotic preferences" used in macro-finance, ambiguity aversion, temptation and self-control). The last part of the course explores the recently flourishing literature on stochastic choice (which is related to, but distinct from, discrete choice econometrics).

Prerequisites: basic microeconomic theory at the level of Mas Colell, Whinston, Green; being comfortable with abstract models.

FAS Divisional Distribution: Social Sciences

ECON 2060

Contract Theory

MW 1030 AM - 1145 AM

Oliver Hart

Recent developments in contract theory. Includes hidden action and hidden information models, dynamic agency issues, incomplete contracts, and applications of contract theory to financial contracting, firm boundaries, public ownership, and firm objectives.

Econometric Methods

MW 0430 PM - 0545 PM

Course ID: 120662
2026 Spring (4 Credits)

This course continues the first year sequence in econometrics and covers a variety of topics and ideas that are important for pursuing and interpreting empirical research in economics. The first half of the course covers core econometric approaches that are important for a wide range of applications, including identification analysis, asymptotic approximations, large sample theory for estimation and hypothesis testing, and the bootstrap. The second part of the course examines a range of complementary topics and new developments, including reasons why canonical econometric methods may be unreliable (such as model misspecification, identification failure, and the incidental parameters problem) and extensions of and alternatives to the traditional econometric paradigm (such as partial identification, Bayesian inference, nonparametrics, and machine learning). Economic applications will be discussed throughout. Enrollment limited.

Economics 2120 or equivalent.

FAS Divisional Distribution: Social Sciences

ECON 2142

Time Series

MW 1030 AM - 1145 AM

Neil Shephard

Course ID: 113904
2025 Fall (4 Credits)

Time series centers around three main goals: describing data (e.g. seasonal adjustment, detrending), predicting future variables given the past data, and drawing causal conclusions about the effect of changing one variable on the future path of another. We will delve into principles and methods for all three of these goals. Due to the complexity of these problems, a three-pronged approach is often needed, combining theory, simulation, and data. Throughout problems from Economics and Finance will be used to illustrate time series methods. Likely topics covered include: martingales, theory of prediction, linear models and projection, control, reinforcement learning, causality (e.g. SVAR, local projection), hidden Markov models, stationarity and non-stationarity, spectral and wavelet methods.

Unleashing Novel Data at Scale

No meeting time listed

Melissa Dell

A vast number of important economic questions remain unanswered, in substantial part because the data required to examine them has traditionally been inaccessible. For example, much historical data remains trapped in hard copy. More broadly, information that could elucidate important questions is scattered throughout text, or contained in scans, photographs, videos, or audio files. This course will provide an introduction to deep learning-based methods and other data science tools that can process such sources on a massive scale. The course will cover natural language processing, computer vision, and multimodal methods. Topics in NLP include neural language modeling, topic and sentiment classification, text retrieval named entity recognition, dependency parsing, and knowledge intensive NLP. Topics in computer vision include convolutional neural networks, vision transformers, object detection, document layout analysis, image classification, image retrieval, GANs, and OCR. Efficiently harnessing the power of large-scale computing will receive emphasis throughout the course. By introducing a range of methods to convert diverse information into computable data, we aim to increase the number of questions that students can feasibly research.

The Microeconomics of Development

TR 1030 AM - 1145 AM

Emily Breza

This course covers the microeconomic foundations of development economics. We will focus on market frictions that may hinder growth in developing countries. Topics include labor markets, land markets, and credit markets. We will also discuss the economics of the household and social networks. The course will use both theoretical and empirical tools.

Course ID: 207641

2025 Fall (4 Credits)

Instructor Permission Required

ECON 2411

Advanced Topics in Macroeconomics

R 0300 PM - 0545 PM

Ludwig Straub

This is a class in empirical macroeconomics, covering empirical methods and their relation to structural macroeconomic modeling. Topics include: state-space and sequence-space representations of structural macroeconomic models; basics of time series inference; time series methods for causal identification; uses and limitations of cross-sectional analysis; and a brief overview of non-linear methods. The objective is to bring students to the research frontier in these topics.

Course Note: This is a 6 week course scheduled for the first half of the semester.

FAS Divisional Distribution: None

ECON 2416

Advanced Topics in Empirical Macroeconomics

MW 0430 PM - 0545 PM

Course ID: 207940

2025 Fall (4 Credits)

The course will explore topics in applied macroeconomics, with emphasis on the intersection of empirical analysis and theory. Topics may include monetary policy, fiscal policy, financial frictions, and labor markets. The course will present a variety of empirical methods, such as the narrative approach, VAR analysis, and the use of cross-sectional data in macroeconomics.

FAS Divisional Distribution: None

ECON 2450A

Public Economics and Fiscal Policy I

MW 1200 PM - 0115 PM

Stefanie Stantcheva

This course covers optimal labor income taxation and redistribution, behavioral responses to taxes and transfers, inequality, the distribution and taxation of wealth and capital income, social preferences (normative analysis), dynamic taxation and mechanism design. For each topic, we will cover the theoretical models and the empirical evidence.

Course Note: A good foundation in basic quasi-experimental empirical methods (event studies, diff-in-diff, regression discontinuity) is encouraged.

Prerequisite: (Economics 2010a AND Economics 2010b) OR (Economics 2020a AND Economics 2020b)

Requires: Prerequisite: (Economics 2010a AND Economics 2010b) OR (Economics 2020a AND Economics 2020b)

FAS Divisional Distribution: Social Sciences

ECON 2450B

Public Economics and Fiscal Policy II

TR 0300 PM - 0415 PM

Nadarajan Chetty

This course covers core issues related to the design of public policies and is the second course offered in the Public Economics sequence at Harvard in 2024-25. The first part of this course analyzes (1) optimal labor income taxes and transfers, (2) tax evasion, avoidance, and enforcement, and (3) capital taxation and aspects of social security. The second part analyzes (4) social insurance, (5) externalities, public goods and the environment, (6) innovation policies, and (7) distributional effects of inflation and recent advances in empirical methods. For each topic, we will cover the theoretical models and the empirical evidence.

Course Note: Students are encouraged to take Economics 2450a before taking 2450b. In addition to the requirements above, you are strongly encouraged to review i) labor supply concepts (Hicksian elasticity, Marshallian elasticity, income effects); ii) "dynamic programming" and "optimal control methods"; iii) constrained

optimization and the envelope theorem.

Prerequisite: (Economics 2010a AND Economics 2010b) OR (Economics 2020a AND Economics 2020b).

Requires: Prerequisite: (Economics 2010a AND Economics 2010b) OR (Economics 2020a AND Economics 2020b)

Field Experiments

W 0300 PM - 0530 PM

Michael Norton, Alex Chan

Social scientists are increasingly implementing field experiments to test theories and evaluate policies. Examples range from randomizing a company's advertising strategies to varying job offer details to prospective employees. Some field experiments are run in close collaboration with organizations, while others are run without any organizational involvement. Many companies and governments are also now running experiments at very large scale. This doctoral course will explore field experiments in the social sciences. The course has three goals for students: 1. To develop the tools to design, implement, and analyze a field experiment. 2. To gain an understanding of the strengths and limits of field experiments. 3. To assess examples of field experiments that have been run, and the insights that have been gained from them. The primary deliverable will be an in-depth proposal for a field experiment.

Course Note: This course is cross listed with Field Experiments HBSDOC 4430.

This course is intended for students who have completed the first year of PhD methods. First year students may petition to be enrolled.

ECON 2723

Theoretical and Empirical Perspectives on Entrepreneurship and Innovation

Course ID: 124076
2026 Spring (4 Credits)

T 0945 AM - 1145 AM

Shai Bernstein

TEPEI explores scholarly work from economics and finance disciplines regarding entrepreneurship—the formation and growth of new firms—and its implications for innovation and growth. While work on this topic dates back to Schumpeter and even earlier, academic research regarding entrepreneurship has exploded over the last decade. The nine-week "core" component will the connections between economic theory—particularly in contract theory, organizational economics, and corporate finance--and empirical work. Among the topics that will be covered are the rationale for entrepreneurial firms, the structure of arrangements between entrepreneurs and investors, the relationship with larger entities, entrepreneurial strategy, the development of new ideas and its relationship to organizational form, and the decision to go public. We will also seek to understand key data sets for research . At the same time, these are dynamic fields, with new topics attracting academic (and real world) interest. Reflecting this dynamism, the nine core weeks will be followed by four weeks of special topics that will vary from year-to-year.

Course Note: Offered jointly with the Business School as 4350.

Economics of Science

R 0300 PM - 0545 PM

Richard Freeman

Course ID: 124078
2026 Spring (4 Credits)

Covers economic incentives that drive science and scientists in creating new knowledge and effect of scientific-technological advance on the economy. First part of course examines global spread of science, with particular attention to rise of China as scientific super-power and beginning emergence of India, decisions of students to choose scientific careers and rise of graduate student unions and post-docs groups; use of tenure tournaments in motivating academic science, network analysis of scientific co-authorship and citations of papers; the development of "slippery science" from replication problems to fraud; increased use of machine learning AI tools in scientific discovery; and demand for R&D by firms seeking new technologies and products. Second part of course analyzes impact of increased scientific knowledge on economic innovation, with attention to private and social returns, patenting system; creation of new products and technical processes; clinical research trials in medicine with NIH as major funder and FDA approval of drugs as key regulator of pharma; govt support of science via spending, DARPA and related innovative research programs, and role of international students on visas.

Course Note: Key requirement is graduate-level research paper, potentially using big data set on scholarly paper, R&D spending, patents, etc.

Attendance at the Economics of Science & Engineering Seminar is strongly suggested.

---	---

Selected topics in environmental and resource economics. Emphasizes theoretical models, quantitative empirical analysis, and public policy applications. Includes invited outside speakers. Part one of a two part series. The curriculum for this course builds throughout the academic year. Students must to complete both terms of this course (parts A and B) within the same academic year in order to receive credit.

Course Note: Primarily for graduate students in economics or related fields with environmental interests. Offered jointly with the Kennedy School as API-905Y.

For Econ students only: Please enter for Ec 3000 in the fall to ensure you receive full credit for Econ 3116

Graduate-level course in microeconomic theory.

Developmental Psychology

T 1030 AM - 1230 PM

Paul Harris

Course ID: 218915
2025 Fall (4 Credits)

This course is an introduction to the theories and findings in developmental psychology. It covers the period of early childhood, but discussion will often extend to older children and adults. The course will cover attachment, pretense and imagination, theory of mind/autism, language and thought, memory, moral development, emotion and emotion understanding, vocabulary growth, cross-cultural variation in relationships and thinking, trust in others' testimony, thinking and reasoning, and religious development. An important goal is to allow students to examine for themselves not just the conclusions that psychologists have reached about development but also some of the experiments and observations that have led to those conclusions. Learning Goals: The purpose of this course is to introduce you to theories and findings in developmental psychology. The main emphasis will be on early childhood – roughly the period from 18 months to 6 years but for some topics we will also discuss development through adulthood. An important goal is to introduce you to some of the major theorists in developmental psychology (e.g., Bowlby, Piaget, Vygotsky, Kohlberg) as well as more contemporary researchers. A second goal is to enable you to examine for yourself, not just the conclusions that have been reached about development, but also some of the influential experiments and observations that have led to those conclusions.

EDST 103

Philosophy of Education

M 0830 AM - 1020 AM

Catherine Elgin

Course ID: 218916
2025 Fall (4 Credits)

What is education? What are its goals? Why is education of value? Are these questions that can be settled once and for all, or do their answers depend on historical and cultural factors? In an effort to answer these questions, we will study works of philosophers such as Plato, Rousseau, Wollstonecraft, Du Bois, Washington, and Dewey. Two papers are required. No prerequisites; no previous work in philosophy is required. Open to any student who wants to think seriously about the fundamental nature and purposes of education.

FAS Divisional Distribution: Arts and Humanities

EDST 121

Educational Outcomes in Cross-National and Cross-Cultural Perspectives

R 1030 AM - 1145 AM

Paul Harris

Course ID: 218918
2026 Spring (4 Credits)

A great deal of thinking about the relationship between psychology and education asks what psychology can contribute to the improvement of education. For example, can psychology help to improve the way that we teach reading? Can it help to close the gap in achievement between particular groups? Do preschoolers have ideas or dispositions that help--or hinder--their progress in school? However, one can also ask about the effects of education on psychological processes. There is enormous cross-national and cross-cultural variation in the length and type of education that children receive. A major goal of this course is to help students understand the effects of such variation on the ways that people think--and feel. A secondary goal is to alert students to the ways in which those effects can be measured and to underline the contribution that different methods--experiments, large-scale surveys, and participant observation--can make to our understanding of such effects. The final goal is to underline how educational provision and its impact vary dramatically across the globe. Learning Goals: There is enormous variation in the length and type of education that children receive. A major goal of this course is to help you think about and understand the effects of such variation on the way that children end up thinking - and the values they hold. A secondary goal is to alert you to the ways in which those effects can be measured and to underline the contribution that different methods - small-scale experiments, large surveys, qualitative and observational studies - can make to our understanding of such effects. The final goal is to underline how far educational provision and its impact have varied in the course of history and currently vary across the globe. Career Focus: This course is co-listed at HGSE and The Harvard Chan School of Public Health. It is designed for masters and doctoral level students from across the University who are interested in the design, testing, and implementation of innovative, science-based strategies to promote the healthy development of

young children facing adversity. Aspiring innovators and change agents with an interest in early childhood policy and practice are especially welcome.

No prerequisites; some background in either psychology or international education desirable.

EDST 124

Foundations of Schooling and Teaching

TR 1030 AM - 1145 AM

Beth Simpson

Course ID: 218921
2026 Spring (4 Credits)

Instructor Permission Required

The purpose of this course is to engage in an in depth investigation of the work of teaching. The course is designed for students who intend to enter the profession of teaching for the first time. Specifically, students will look at teachers' work in relation to students, the curriculum, and the school and the policy settings in which they are situated. This course strikes a balance between understanding focal topics from a theoretical and empirical perspective and investigating them from a practical, more hands on approach. The latter is achieved through the frequent use of case studies, videos of teaching practice, and reference to students' experiences in classroom settings. Permission of instructor required. Enrollment for this course may be limited. Preference given to undergraduate students currently pursuing a secondary in Educational Studies or intending to pursue a secondary in Educational Studies. Open to Ed.M. students. Enrollment procedure will be posted on the course website

FAS Divisional Distribution: Social Sciences

EDST 125

Children with Learning and Developmental Differences

M 1000 AM - 1200 PM

Nadine Gaab

Course ID: 218922
2026 Spring (4 Credits)

Instructor Permission Required

The duration of education is a strong predictor of health and longevity, but approximately 1 in 5 children with learning or attention issues have long-lasting negative consequences related to their academic, social, mental health, vocational, economic outcomes. In the US, over 2 million students struggle with specific learning disabilities (SLD), which represents roughly 35% of all students who receive special education services under the Individuals with Disabilities Education Act. Children with a learning disability are less likely to complete high school or enroll in postsecondary educational programs and have a heightened risk for developing mental health problems such as depression or anxiety. Currently, SLDs are primarily identified and addressed within the education system; however, these students also receive care and support outside of school and are members of various community settings. A streamlined approach that informs the coordination of general education, special education, clinical psychology, policymaking, advocacy, caregivers, and health professionals (e.g., pediatricians, speech-and language pathologists) is often absent and hinders the design of preventive approaches, identification strategies, and service implementation. It further leads to a siloed approach for care and policymaking, lack of community supports. The course will provide a broad overview of learning disabilities and differences, including dyslexia, dyscalculia, attention deficit/hyperactivity disorder, developmental language disorder, and autism spectrum disorder, as well as the relevant policies and educational documentation for these learners. It will then cover the professional stakeholders that should be involved in an evidence-based response to a learning difference, and identify their unique knowledge base, toolset, developmental timeline, and communication strategies, both in the educational/professional environment and the community. Finally, we will focus on barriers and challenges faced by children with learning differences in the academic, professional, and community settings. Throughout the course, students will be provided with both research/evidence-based content and case-based learning opportunities, practical examples, and guest speakers drawn from the community. Class activities will include both synchronous and asynchronous learning activities led by the Instructor (Prof. Nadine Gaab), along with breakout sessions overseen by the instructor and/or Teaching Fellows. This course is divided into thirds and will cover: (1) a broad overview of learning disabilities, educational policies, and service documentation; (2) stakeholders in academic and professional settings, including their unique knowledge base, toolset, developmental timeline, and communication strategies, barriers faced by children with learning differences in these settings, existing solutions to these barriers; and (3) stakeholders in community settings, barriers faced by individuals with learners in these settings, existing solutions to these challenges.

FAS Divisional Distribution: Social Sciences

How might the study of our collective past and present through a comparative, humanizing lens support our ability to contextualize and confront the challenges of our present? This course introduces students to the origins, epistemologies, frameworks, key concepts, and central questions in the field and community of Ethnic Studies, while applying these concepts and questions to our own educational experiences and the various contexts that we navigate. The course begins with an examination and analysis of self and impact of dominant and counter narratives throughout history, which will provide a foundation for the second half of the course when we examine more recent histories and issues faced by communities of color, including the ongoing struggle for Ethnic Studies here at Harvard. Topics will include, but are not limited to: settler colonialism, race, racism, ethnicity, migration, labor, colonialism, social movements, oppression, intergenerational trauma and resilience, white supremacy, power, agency, liberation, intersectionality, community action, healing centered engagement, solidarity, and social change. This course is designed to be both an individual and collective journey that challenges each of us to critically reflect upon what it means to authentically exercise solidarity in ways that actively interrupt oppression and humanize all participants in classrooms, communities, and beyond.

FAS Divisional Distribution: Social Sciences

Adolescence marks change on multiple levels (e.g., biologically, cognitively, and socially) and in multiple contexts (e.g., family, school, community, and peers). In fact, it marks the largest growth period in human development outside of infancy. Driven by enhanced thinking and reasoning capabilities, adolescents struggle with balancing their desires for autonomy and independence with their desires for guidance and connection. These dynamics result in renegotiating family and social relationships and engagement in school, impact the effectiveness of educational practices, and enhance adolescents' ability to think and plan for their future. This course is designed to provide a practical understanding of the developmental issues, assets, and trajectories of adolescent thinking and reasoning. Based in classic and current theory and research and using real problems of practice, students will learn, integrate, and apply knowledge of biological and cognitive development and of identity processes. This course will prepare educational practitioners to integrate developmental approaches to their pedagogy and provide a foundation for those interested in applied research on adolescence. No prerequisites; prior course work in developmental psychology is helpful, but the course is designed for students without a psychology background. Recommended for students who are planning to work directly with adolescents or are planning to engage in applied research with adolescents.

Requires: Must be a declared Educational Studies student or at least a Junior to enroll.

FAS Divisional Distribution: Social Sciences

Education is a universal human activity, but how it is understood and practiced vary widely across cultures. When immersed in our own upbringing and educational experiences, we can easily take our beliefs and practices for granted, while overlooking cross-cultural variation and making inaccurate generalization about people from different backgrounds. That is why it is important to take a cross-cultural approach in the study of education. It not only helps us understand the diversity and universalities in educational practices around the world, but also invites us to see our own experiences in a new light and reflect on how our beliefs about learning, teaching, and parenting have been shaped by our cultural backgrounds. In this course, we will examine the interplay between education and culture, focusing on beliefs and practices in schools and families across various cultures. Specifically, we will investigate how cultural values and assumptions shape parent-child interactions, teacher-student dynamics, teaching and learning approaches, and educational systems. We will also consider how these factors impact child development, student well-being and academic achievement, and the experiences of immigrant and international students.

EDST 138

Neuroscience and Education: Foundations, Development, and Applications

M 1000 AM - 1200 PM

Nadine Gaab

Course ID: 224531

2025 Fall (4 Credits)

Instructor Permission Required

The field of neuroscience can deliver a biological level of description to better understand how students learn. It can offer an alternative perspective on learning principles, skill development, and learning differences including their underlying etiologies. However, the role of this body of knowledge for developing pedagogical principles, interventions, or public policy, has been debated. Furthermore, this knowledge is often translated into educational contexts, inefficaciously leading to overgeneralizations, myths, and ineffective practices harming students. In this course, students will be introduced to the brain's structure and function, how the it brain changes over time, and the methods used to study the brain and its development and plasticity. Students will further identify and dispel common brain myths in educational contexts and learn to evaluate scientific evidence and approaches related to brain development and 'brain training' programs. Students will then learn about specific domains of development critical in educational contexts, including the acquisition of language, reading and math skills, attention, emotions, social interactions, and how environmental factors can alter developmental trajectories. Students will review both the typical developmental pattern experienced by most children and specific developmental differences and disabilities relevant in educational contexts. The course has a strong translational component and includes specific practical applications of the course content to challenges and demands in educational contexts and policy, which is reflected in the assessments. Class activities will consist of both synchronous and asynchronous learning activities led by the instructor.

EDST 139

Bilingual Learners: Literacy Development and Instruction

No meeting time listed

Paola Uccelli

Course ID: 224629

2025 Fall (4 Credits)

As the number of children who speak, or are exposed to, more than one language increases in U.S. classrooms and in classrooms around the world, educators at all system levels and across varied settings must be prepared to provide high-quality, rigorous education to ever more linguistically diverse groups of students. Designed for researchers and practitioners, this course focuses on the pressing issues related to bilingual students' language and literacy instruction. The term "bilingual" in this course will be used to refer to a variety of students who have diverse and unequal experiences in more than one language and who speak or hear a language different from the societal language at home, but who might receive bilingual or monolingual instruction at school. The course employs an interdisciplinary perspective, drawing on sociocultural, psycho-linguistic, and educational frameworks of research conducted in the United States and in various international contexts. A number of societal factors related to language, literacy, and academic achievement will be explored: the many modes of being bilingual or multilingual, the role of linguistic minorities in society, the role of educational resources, and the impact of educational policies on bilingual populations. The course will provide opportunities to discuss and investigate the literacy development of bilingual learners, reflect on the important contribution of literacy skills to academic achievement, and learn and reflect about research-based instructional approaches. This course is intended for students who anticipate working with linguistically diverse populations as practitioners, policymakers, or researchers.

Flavor Molecules of Food Fermentation: Exploration and Inquiry

MW 0130 PM - 0245 PM

Pia Sorensen

Course ID: 156947

2026 Spring (4 Credits)

Instructor Permission Required

Microorganisms produce a diverse array of specialized small molecules as part of their metabolic processes. In this course we will study the production, properties, and characterization of these molecules through the lens of food fermentation. In particular, we will focus on the small molecules that contribute taste and aroma in fermented foods. Students will experience the scientific inquiry process in a creative way by designing and implementing their own research project based on a fermented food of their choosing. Still a field with much

potential for discovery, interested students are invited to continue their research project in the summer.

Ls1a , LPSA or equivalent; first semester Organic Chemistry recommended but not required.

ENG-SCI 26

Course ID: 204471

Humanity and its Futures: AI and Human Cognition

2026 Spring (4 Credits)

T 0945 AM - 1230 PM

Instructor Permission Required

Fawwaz Habbal

This course provides students with an understanding of the complexities surrounding today's most intractable problems and helps them develop methodologies for navigating the challenges they will face. After introducing systems thinking, with a focus on interconnections and feedback loops, the course will address a significant interdisciplinary issue: Artificial Intelligence (AI) and its relationship to human cognition. The study of AI and human cognition is both timely and dynamic. This expansive domain integrates computer science, statistics, big data, cognitive science, psychology, and philosophy. As a transformative technology, AI has achieved remarkable success in understanding natural language and emulating human reasoning, making it invaluable in augmenting human cognition. Despite these advances, many questions remain about the nature of AI and its relationship with human thought. This course invites participants to explore these questions through an intellectual journey. Students will engage in discussions on systems and paradigms, the essence of intelligence, computational approaches, mind and machine metaphors, cognitive biases in AI, and the role of AI in creativity and intuition. The course emphasizes collaborative learning, with students working in teams to learn from each other, as well as from lectures and selected literature. Each lecture will be paired with research papers and books, followed by a discussion session. The topics covered in the course are listed in the syllabus. Each will include an overview of the issue and its significance. Students will apply systems thinking and a multidisciplinary approach to analyze and critique each topic. By the end of the course, students will have developed a strong framework for multidisciplinary discussions, gained a deep understanding of AI's power, limitations, and risks, and explored its technical building blocks through hands-on exercises. Additionally, students will experience the value of collaboration and the importance of diversity while working in diverse teams.

Course Note: ES 26 is also offered as ES 294 (for graduate students). Students may not take both for credit. The combined cap for ES 26 and ES 294 is 25 students.

Startups: From Idea to Exit

2025 Fall (4 Credits)

W 1200 PM - 0245 PM

Josh Lerner, Spencer Rascoff

This course explores the stages of a startup business, from idea generation through its scaling stage through its eventual exit. Students will learn how to assess a startup idea, how to raise capital, how to grow teams, how to manage the company through adversity, and how to successfully sell a company. Based on two acclaimed courses at Harvard Business School – "Launching Tech Ventures" and "Scaling Tech Ventures" – the class is half lecture and half panel discussion and student presentations. Classes will draw from Professor Rascoff's extensive startup experience (Zillow, Hotwire, Pacaso, Match Group) and several industry experts will join the class sessions.

Course Note: This course was previously offered as ES134. Please review the Canvas Course Site for information on petitions and enrollment.

ENG-SCI 31

Course ID: 226753

Startup Financing: From Bootstrapping to Venture Capital

2026 Spring (4 Credits)

T 1200 PM - 0245 PM

Instructor Permission Required

Josh Lerner, Richard Bennett

Entrepreneurial businesses, particularly those involving advanced scientific and engineering elements, face daunting challenges while raising money. First, the financing structures used are frequently complex, with terminology that obscures rather than clarifies their basic features. Second, many founders do not understand the strategic tradeoffs associated with funding businesses through bootstrapping, customer financing, angels, and/or venture capital. Finally, financing markets change rapidly over time and vary across industries, frequently leading to inflated expectations and disappointments. This class will shed light on this challenging territory,

highlighting how great startups are funded. While primarily intended for aspiring entrepreneurs, it should also be of interest to students who seek to be involved with funding entrepreneurial firms, whether in a role at a venture firm, investment bank, or incubator.

ES 30 (formerly ES 134) recommended.

ENG-SCI 50

Introduction to Electrical Engineering

MW 1115 AM - 1230 PM

Marko Loncar

The main course objectives are to introduce students to the exciting and powerful world of electrical engineering and to explain how gadgets that we use every day actually work. After taking ES 50, you will be able to leverage the power of electricity to build systems that sense, control and program the physical world around you. Examples include intelligent and autonomous systems (robots), audio amplifiers (e.g. guitar amp), interactive art installations, light-shows, mind-controlled machines, and so on.

Enthusiasm, curiosity and desire to build things! Previous engineering or programming experience is NOT needed. The amount of high school physics required is minimal, and is limited to basic concepts only.

ENG-SCI 53

Quantitative Physiology as a Basis for Bioengineering

MWF 1115 AM - 1230 PM

Linsey Moyer

Course ID: 122339

2025 Fall (4 Credits)

This course is designed as an introduction to thinking as a bio/biomedical engineer and is recommended for first years and sophomores but open to all students. Simple mathematical models are used to represent key aspects of organ systems function. Core engineering concepts are explored through mechanical and electrical examples within the human body. The primary focus is on quantitative descriptions of organ systems function and control in terms of physical principles and physiologic mechanisms. It includes a foundation in human organ systems physiology, including cardiovascular, pulmonary, and renal systems. Emphasis will be given to understanding the ways in which dysfunction in these systems gives rise to common human disease processes.

Course Note: Open to first-year students. Course includes a 3-hour lab section once per week.

Calculus at the high school level

Engineering Design Projects

T 0215 PM - 0330 PM

Katia Bertoldi

Course ID: 144350
2025 Fall (2 Credits)

Instructor Permission Required

Individual engineering design projects which demonstrate mastery of engineering knowledge and techniques. Each student will pursue an appropriate capstone project which involves both engineering design and quantitative analysis. This culminates in a final oral presentation and final report/thesis. Students must complete both parts of this course, fall and spring, in order to receive credit.

Course Note: Ordinarily taken in the senior year. Students are expected to have an approved project submitted to the course by the Limited Enrollment Course Petitions deadline (April 8, 2025 for fall 2025) in the spring semester preceding actual enrollment. Formal project approval rests with the project advisor and the ES100 teaching staff. The course includes weekly required lectures at the Tuesday time and classroom listed above (fall only) and weekly section on Thursday (fall and spring) in locations to be posted on Canvas.

Requires: Pre-Requisite: ENG-SCI 96 OR ENG-SCI 227

Full Year Course: Indivisible Course

FAS Divisional Distribution: None

ENG-SCI 100HFB

Humanitarian Design Projects

T 0600 PM - 0715 PM

Chris Lombardo

Course ID: 208045
2025 Fall (2 Credits)

Instructor Permission Required

Multi-year long team projects that provide an engineering experience working with partner communities on real-world problems. Projects provide exposure to problem definition, quantitative analysis, modeling, generation of creative solutions utilizing appropriate technology, engineering design trade-offs, and documentation/communication skills. These projects will be implemented with our project partners after the appropriate design and approvals have been obtained.

Course Note: This course is part of a two-semester sequence. Students are strongly encouraged to enroll in ENG-SCI 105HFR in two consecutive semesters. Enrollment limited. This course was formerly offered as ENG-SCI 91HFR.

Introduction to Scientific Computing

2025 Fall (4 Credits)

TR 1200 PM - 0115 PM

Sarah Iams

Many science and engineering problems don't have simple analytical solutions or even accurate analytical approximations. Scientific computing can address certain of these problems successfully, providing unique insight. This course introduces some of the widely used techniques in scientific computing through examples chosen from physics, chemistry, biology, computer science and other fields. The purpose of the course is to introduce methods that are useful in applications and research and to give the students hands-on experience with these methods. The main programming language will be Python.

Course Note: Engineering Sciences 111 is also offered as Applied Mathematics 111. Students may not take both for credit. Undergraduate Engineering Students should enroll in Engineering Sciences 111.

Mathematics 1b, 21a, and 21b

Requires: Pre Req: APMTH 10, COMPSCI 32, or COMPSCI 50.

Anti-Req: Students may not take APMTH/ES 111 after APMTH 205 or simultaneously with APMTH 205.

FAS Divisional Distribution: Science & Engineering & Applied Science

Thermodynamics

2026 Spring (4 Credits)

MW 1200 PM - 0115 PM

*Instructor Permission Required**Scot Martin*

Fundamental concepts and formalisms of conservation of energy and increase of entropy as applied to natural and engineered environmental and biological systems. In addition to lectures, pedagogical approach includes real-world observations and applications through student presentations and projects.

Course Note: ES 112 is also offered as EPS 112. Students may not take both for credit. Undergraduate engineering students should enroll in ES 112. Total class capacity of 18 includes students in both ES 112 and EPS 112. Please see course page for lottery instructions.

FAS Divisional Distribution: Science & Engineering & Applied Science

Mathematical Modeling

2025 Fall (4 Credits)

TR 1030 AM - 1145 AM

Michael P. Brenner

Abstracting the essential components and mechanisms from a natural system to produce a mathematical model, which can be analyzed with a variety of formal mathematical methods, is perhaps the most important, but least understood, task in applied mathematics. This course approaches a number of problems without the prejudice of trying to apply a particular method of solution. Topics drawn from biology, economics, engineering, physical and social sciences.

Course Note: Engineering Sciences 115 is also offered as Applied Mathematics 115. Students may not take both for credit. Undergraduate Engineering Students should enroll in Engineering Sciences 115.

Prerequisite: Applied Mathematics 21a and 21b, or Mathematics 21a and 21b or permission of instructor. Taking APMTH 105 OR APMTH 108 OR APMTH 104 OR MATH 112 OR STAT 110 before taking APMTH 115 is recommended but not required.

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 115

Mathematical Modeling

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 120

Introduction to the Mechanics of Solids

TR 1030 AM - 1145 AM

Mark Coughlin

A first course in the mechanical sciences that introduces elements of continuum mechanics and explains how materials and structures stretch, bend, twist, shake, buckle, and break. Definitions of stress and strain. Strain-displacement relations. Stress-strain behavior of materials. Torsion, beam theory with applications to beam deflections, buckling, and energy methods. Statically determinate and indeterminate structures. Three laboratory sessions required. Strong emphasis on analytical skills and mathematics.

Prerequisite: Mathematics 21a or Applied Mathematics 21a (or equivalent, previously); and Physical Sciences 12a, Physics 15a, or Applied Physics 50a (previously); and Mathematics 21b or Applied Mathematics 21b (or equivalent, previously or concurrently). Working knowledge of trigonometry, linear algebra, analytical integration, and differential equations.

Requires: Prerequisite: Math 21a or Applied Math 21a (or equivalent); AND Physical Sciences 12a, Physics 15a, or Applied Physics 50a; AND Co-requisite: Math 21b or Applied Math 21b (or equivalent)

FAS Divisional Distribution: Science & Engineering & Applied Science

Quantitative Reasoning with Data: Yes

ENG-SCI 121

Introduction to Optimization: Models and Methods

MWF 1200 PM - 0115 PM

Margo Levine

This course provides an introduction to basic mathematical ideas and computational methods for optimization. Topics include linear programming, integer programming, branch-and-bound, branch-and-cut, as well as first-order gradient-based methods with an emphasis on modeling and data science applications.

Course Note: Engineering Sciences 121 is also offered as Applied Mathematics 121. Students may not take both for credit. Undergraduate Engineering Students should enroll in Engineering Sciences 121.

Mathematics 21b or equivalent preparation in linear algebra. Basic programming.

Introduction to Fluid Mechanics and Transport Processes

MWF 0900 AM - 1015 AM

Zachary Schiffer

Atomistic-Mesoscale-Continuum Fluids and Flows; Dimensional Analysis; Diffusion and Heat Transfer Processes; Fluid kinematics; Eulerian and Lagrangian descriptions of Flows; Mass conservation and potential flows; Momentum conservation and the Navier-Stokes equations; Vorticity and Vortices; Lift and Drag in Aerodynamics; Flows in Pipes and Channels; Elementary concepts of Turbulent flows.

In addition to course prerequisites listed below, programming expertise (to the level of AM10) is highly recommended.

Requires: Prerequisite: (Applied Math 21a or Math 21a or equivalent) AND (Applied Math 21b or Math 21b or equivalent) AND (APPHY 50a or PHYSCI 12a or Physics 15a)

FAS Divisional Distribution: Science & Engineering & Applied Science

Mechanical Systems

MW 1245 PM - 0200 PM

Robert Wood

Modeling and analysis of mechanical systems. Topics include 3D rigid body dynamics, resonance, damping, frequency response, Laplace transform methods, Lagrange's equations, multiple degree-of-freedom systems and an introduction to control and continuous systems. Analytical modeling will be supplemented with numerical simulations and lab experiments. Laboratory exercises will explore vibration, and stabilization using data acquisition systems.

Requires: Prerequisite: Math 21a and 21b (or equivalents); and Physical Sciences 12a (or equivalent)

FAS Divisional Distribution: Science & Engineering & Applied Science

Computational Solid and Structural Mechanics

TR 0900 AM - 1015 AM

Katia Bertoldi

Introduction to finite element methods for analysis of steady-state and transient problems in solid and structural mechanics. Implementation of simple MATLAB codes and use of existing general-purpose software (ABAQUS). Final project offers opportunities to extend focus to fluid mechanics and heat transfer and to explore additional software (e.g. COMSOL, FEniCS), if desired.

Course Note: Offered alternate years.

Engineering Sciences 120 or equivalent introduction to the mechanics of deformable materials.

FAS Divisional Distribution: Science & Engineering & Applied Science

Innovation in Science and Engineering: Conference Course

TR 0130 PM - 0245 PM

David Ricketts

This class integrates perspectives from leading innovators with collaborative practice and theory of innovation to teach and inspire you to be more innovative in your life and career. Our approach is to engage with leaders and learn their perspectives and align this with innovation sprints where you learn the best tools, processes, and methods to innovate. You can see a course overview here <https://youtu.be/CqfvXf33TCE>. Find out more information on Instagram @engsci139 or <https://www.instagram.com/engsci139/>

Course Note: Offered jointly with the Design School as SCI-6272.

The course will be taught in two sessions per week, each with a different focus. One session will focus on Innovation Perspective and often contain guest lectures by innovators. The second session will focus on Innovation Practice and will contain interactive group work, case studies, and other educational formats about specific innovation ideas and tools. These may be taught on different days or both days, with first-half Perspective and second-half Practice.

The course will be held in person. Some classes may be held at alternative times depending on the schedule of guest speakers.

Requires: Anti-Req: May not be taken for credit if ENG-SCI 239 already complete

FAS Divisional Distribution: None

ENG-SCI 143

Computer Vision

TR 0945 AM - 1100 AM

Todd Zickler

An introduction to the mathematical, optical, and computational foundations of computer vision, with a focus on applications in augmented reality and robotic perception. Topics include: camera optics, digital color photography pipelines, multi-camera geometry, image processing and manipulation, simultaneous localization and mapping, lighting and material estimation, and 3D scanning. Emphasis on combining mathematical modeling with robust algorithms for solving ill-posed problems.

Applied Mathematics 22a or Mathematics 21b, Computer Science 51 or 61.

FAS Divisional Distribution: Science & Engineering & Applied Science

Course ID: 216372

2025 Fall (4 Credits)

ENG-SCI 150

Probability with Engineering Applications

TR 0945 AM - 1100 AM

Yue Lu

This course introduces the fundamentals of probability theory for parameter estimation and decision making under uncertainty. It considers applications to information systems as well as other physical and biological systems. Topics include: discrete and continuous random variables, conditional expectations, Bayes' rules, laws of large numbers, central limit theorems, Markov chains, Bayesian statistical inferences, and parameter estimations.

Requires: Prerequisite: (Applied Math 21a or Math 21a or equivalent) AND Corequisite: (Applied Math 21b or Math 21b or equivalent)

FAS Divisional Distribution: Science & Engineering & Applied Science

Course ID: 116859

2026 Spring (4 Credits)

ENG-SCI 151

Applied Electromagnetism

MW 1245 PM - 0200 PM

Evelyn Hu

Electromagnetism and its applications in science and technology. Topics: Maxwell's equations; electromagnetic waves (e.g., light, microwaves, etc.); wave propagation through media discontinuity; transmission lines, waveguides, and microwave circuits; radiation and antennae; interactions between electromagnetic fields and matters; optics of solids; optical devices; origin of colors; interference and diffraction; lasers and masers; nuclear magnetic resonance and MRI; radio astronomy; wireless networking; plasmonic wave (charge density wave).

Course Note: This course will include a few short laboratory sessions.

Very useful to have had some introduction to basic electromagnetism as well as physics (Applied Physics 50b, Physical Sciences 12b, or 15b or equivalent), and basic vector calculus (Math 21a or equivalent).

Requires: Prerequisite: Math 21a (or equivalent); and Physical Sciences 12a and 12b, Physics 15a and 15b, or Applied Physics 50a and 50b

FAS Divisional Distribution: Science & Engineering & Applied Science

Course ID: 143005

2026 Spring (4 Credits)

ENG-SCI 152

Circuits, Devices, and Transduction

MW 0215 PM - 0330 PM

Gage Hills

This course introduces the fundamentals of circuit theory for the analysis of electrical circuits and the

Course ID: 207597

2025 Fall (4 Credits)

fundamentals of semiconductor devices for the understanding of transistors circuits and other useful actuators and sensors (i.e., transducers). Building on the principles from these two core fundamental areas of electrical engineering, the analog behavior of electronic circuits and physical devices will be modelled, analyzed, and applied. Lab assignments will focus on the design, implementation, and measurement of analog electronic circuits using real electrical components which interface to the physical world. This course complements and forms the basis for many of the abstractions that are used in digital computing systems such as in COMPSCI 1410 (formerly 141), COMPSCI 1411 (formerly 146), and COMPSCI 1480 (formerly 148).

Requires: Prerequisite: Math 1a and 1b; AND Co-requisite: Physical Sciences 12b or Physics15b or Applied Physics 50b

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 155

Systems and Control

TR 1245 PM - 0200 PM

Na Li

This course and its follow-on course ENG-SCI 156 concern the fundamentals of information systems in the real world. Together they provide a comprehensive foundation in signal processing, systems design and analysis, control, and communications, while also introducing key linear-algebraic concepts in the context of authentic applications. The first course, ENG-SCI 155, focuses on the basic principles of feedback and its use as a tool for inferring and/or altering the dynamics of systems under uncertainty. Topics include linear algebra, the elemental representations of dynamic systems, stability analysis, the design of estimators (e.g., Kalman Filter) and feedback controllers (e.g., PID and Optimal Controller). The class includes both the practical and theoretical aspects of the topic.

Applied math 21a, b or Math 21a, b or equivalent are encouraged to be taken concurrently but not required. Additional sections and materials of linear algebra will be provided in the course.

Requires: Prerequisite: Math 1a and Math 1b

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 156

Signals and Communications

TR 1115 AM - 1230 PM

Flavio du Pin Calmon

This course is a follow-on to ENG-SCI 155 and continues to develop the fundamentals of information systems in the real world. It focuses on the analysis and manipulation of signals in the time and frequency domains in the context of authentic applications. Topics include: the sampling theorem, convolution, and linear input-output systems in continuous and discrete time. Further, students are introduced to transforms—including Fourier, discrete cosine, wavelet, and PCA / SVD 'transforms'—that map between vector spaces via matrix multiplication as a method to ease analysis provided conditionalized knowledge. Randomness, noise, and filtering. Waves and interference in the context of communications; antennae, phasors, modulation, multiplexing. Applications in communications and data science.

Applied Mathematics 21b or Mathematics 21b.

Requires: Prerequisite: Math 21a and Math 21b (or equivalents), or Applied Math 22a

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 157

Biological Signal Processing

TR 1115 AM - 1230 PM

Demba Ba

This is the first course on Biological Signal Processing, the science of collection, representation, manipulation, transformation, storing of biological signals, and the use of modern scientific computing tools (Python, Jupyter notebooks) to interpret biological signals and tell engaging and informative stories using biological data. The signals of interest can be deterministic, semi-periodic, transient, random, stationary, non-stationary, etc., depending on their source and generation mechanism. We will use EEG, EKG, temperature data, neural spiking data, and data from Covid-19 as examples. Our focus will be on foundational signal processing concepts that can be applied in a variety of biological applications. Examples include the Fourier Transform, Principal Component Analysis, Clustering, etc. Applications include those to patient monitoring, diagnostics, patient

Course ID: 109358
2025 Fall (4 Credits)

prognostics, online monitoring, and the computation of wellness measures. For many of us, one frustrating aspect of Covid-19 is our inability to understand figures that are reported, such as infection rates and numbers. We will introduce you to a powerful suite of mathematical and scientific computing tools will enable you to evaluate and make decisions based on evidence and data.

It is helpful, but not necessary, for students to have taken Engineering Sciences 150 or 156 prior to Engineering Sciences 157.

Requires: Prerequisite: Math 21a and Math 21b (or equivalents)

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 158

Introduction to Optimal Control and Reinforcement Learning

MW 0215 PM - 0330 PM

Heng Yang

This course covers optimal control and reinforcement learning for dynamical systems, with a strong emphasis on robotic applications such as quadrupeds and humanoids. The first half focuses on optimal control for systems with known, potentially nonlinear dynamics. Students will learn the fundamentals of dynamic programming and the linear quadratic regulator (LQR) before delving into trajectory optimization and model predictive control (MPC) for nonlinear systems, which emphasizes numerical optimization techniques for synthesizing complex motions. The second half explores reinforcement learning (RL) for systems with unknown dynamics. Topics include both model-free and model-based RL algorithms such as proximal policy optimization (PPO), actor-critic methods, and model-based policy optimization, with a focus on continuous state and action spaces. Additional topics may include Lyapunov analysis, vision-based feedback control, and advanced convex optimization. The course prioritizes computational algorithms over theoretical analysis, equipping students with practical tools for solving complex control problems. Assignments involve programming in Python and MATLAB to control simulated dynamical systems in MuJoCo and other environments.

Course Note: Engineering Sciences 158 is also offered as Applied Mathematics 158. Students may not take both for credit. Undergraduate Engineering Students should enroll in Engineering Sciences 158.

Familiarity with linear algebra, probabilistics, calculus, and programming (Matlab, Python, etc.). Knowledge about control theory (ES 155) and optimization (AM/ES 121) is recommended.

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 159

Introduction to Robotics

TR 1115 AM - 1230 PM

Robert D. Howe

Introduction to computer-controlled robotic manipulators. Topics include coordinate frames and transformations, forward and inverse kinematic solutions to open-chain manipulators, the Jacobian, dynamics and control, and motion planning. In addition, special topics will be introduced such as computer vision, soft robotics, surgical robots, MEMS and microrobotics, and biomimetic systems. Laboratory exercises will provide experience with industrial robot programming and robot simulation and control.

Course Note: Laboratory will scheduled after classes begin, based on students' and course staff's availability. Eng-Sci 159 is also listed as Eng-Sci 259. Students may not take both for credit. Graduate students must enroll in 259. The material in 259 is the same as in 159, but with additional problems on the problem sets and a final project.

**Linear algebra and multivariable calculus: matrix operations, positive definiteness of a matrix, determinants, complex numbers, eigenvalues and eigenvectors, partial derivatives and integration (e.g., Mathematics 21a,b, Mathematics 22a,b, Mathematics 25a,b, Applied Mathematics 22a,b). *Introductory mechanics: free-body diagrams with masses, springs, and dampers, vector forces and vector torques (e.g., Physics 15a, Physics 16, Physical Sciences 12a, Applied Physics 50a,b). *Programming experience (e.g., CS 50; MATLAB recommended).*

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 170

Engineering Quantum Mechanics

MW 1030 AM - 1145 AM

Course ID: 207088
2025 Fall (4 Credits)

This course will introduce fundamental concepts in quantum mechanics and the associated mathematical frameworks crucial for comprehending emerging quantum technologies, notably quantum computing and the broader field of quantum information science. The central theme of this course revolves around the concept of spin. Students will explore topics such as spin behavior in magnetic fields, interactions between spins, spin measurement, the impact of environmental factors on spins, and more. Through this spin-centric approach, the course will elucidate various quantum mechanical concepts, including uncertainty, superposition, and entanglement. Most importantly, it will equip students with an understanding of how spin states can function as qubits, the fundamental units of quantum information. Additionally, the course will survey the latest advancements in qubit technologies, delving into their underlying physical quantum states, hardware implementations, and evaluations of their resilience against external influences.

Basic linear algebra and calculus background at the level of Math 21a (multivariable calculus), Math 21b (linear algebra), or AM 22a.

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 176

Course ID: 127589
2025 Fall (4 Credits)

Introduction to Microelectromechanical Systems

TR 1030 AM - 1145 AM

Instructor Permission Required

Fawwaz Habbal

The goal of this multidisciplinary course is to enable students to learn how to create miniaturized devices. In addition to the weekly lectures, hand-on activities will lead students to become capable of creating micro-nano devices. Students will understand the physics of sensors and actuators, become familiar with thin-film fabrication technologies, and understanding how these concepts were commercialized. Learning is in small teams – together, students design, simulate, build, edit, discuss, and critique their work. Students will make basic structures using lithography, deposition, and etching. Next, they integrate such structures to create, testable, devices. At the end of the semester, they reverse-engineer some commercial devices and reflect on their fabrication and function.

Course Note: ES 176 is also offered as ES 276. Students may not take both for credit. Students who enroll in ES 176 will learn similar content as students who enroll in ES 276 but may have fewer demanding experiments. Course includes an active learning component of labs and simulations, usually on Thursdays. Students will also use CNS on per demand bases.

Applied Physics 50a,b, Physical Sciences 12a,b, Physics 11a,b (no longer offered) or 15a,b; College Chemistry at the level of Life Sciences 1a and Physical Sciences 1.

ENG-SCI 177

Course ID: 109356
2026 Spring (4 Credits)

Microfabrication Laboratory

M 0945 AM - 1145 AM

Kiyoul Yang

The course provides introduction to micro- and nano-fabrication processes used to realize photonic, electronic and mechanical devices. Lectures will introduce the state-of-the-art semiconductor fabrication processes, including lithography, deposition of metals and dielectrics, etching, oxidation, implantation, and diffusion of dopants. The fabrication component of the course will be carried out in a state-of-the-art cleanroom in the Center for Nanoscale Systems, where students will fabricate several electronic and photonic devices, including transistors, light-emitting diodes (LEDs), lasers and optical resonators. Device characterization will be performed in a state-of-the-art teaching labs in SEC in Allston.

Course Note: Course also includes a 4-hour lab session each week.

Requires: Prerequisite: (Applied Physics 50a OR Physical Sciences 12a OR Physics 15a) AND (Applied Physics 50b OR Physical Sciences 12b OR Physics 15b)

FAS Divisional Distribution: Science & Engineering & Applied Science

Engineering Thermodynamics

MW 0300 PM - 0415 PM

Zhigang Suo

Basic algorithm of thermodynamics. Entropy. Energy, space, matter. Free energy. Isolated, thermal, closed, open systems. Refrigerators and power cycles. Chemical Reactions. Phase and chemical equilibrium in multicomponent systems; chemical potential. Batteries, fuel cells. Laboratory included.

Course Note: Course includes three labs during term. Students should refer to the Canvas site for details and to sign up.

High school AP chemistry or higher.

Requires: Prerequisite: Physical Sciences 12a, Physics 15a, or Applied Physics 50a

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 183

Introduction to Heat Transfer

TR 1245 PM - 0200 PM

David Clarke

The macroscopic description of the fundamentals of heat transfer and their application to practical problems in energy conversion, electronics and living systems with an emphasis on developing a physical and analytical understanding of conductive, convective and radiative heat transfer. Emphasis will be given to problem solving skills based on applying governing principles, mathematical models and physical intuition. Topics include: steady state heat conduction in 1, 2 and 3D; transient heat conduction in 1D and 3D; introduction to convective heat transfer, forced convection as well as free convection; heat exchange analysis and design; elements of radiative heat transfer. There will be an emphasis on physical basis of heat transfer with mathematical description where appropriate, as well as using commercially available computer COMSOL software. Course includes (i) classes and problem sets, (ii) COMSOL simulations and (iii) a semester-long, multi-disciplinary team project.

Requires: Prerequisite: (Applied Math 21a or Math 21a or equivalent) AND (Applied Math 21b or Math 21b or equivalent) AND (APPHY 50a or PHYSIC 12a or Physics 15a)

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 190

Introduction to Materials Science and Engineering

TR 0900 AM - 1015 AM

Boris Kozinsky

Introduction to the structure, property, and application of materials. Crystal structure and defects. Structure property relation and crystal symmetry. Phase transformation, phase diagram, diffusion. Principles and examples for a variety of engineering applications of electrical, optical, and especially energy storage and conversion materials.

Math 21a and 21b (or equivalents).

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 192

Materials Selection and Design

TR 1245 PM - 0200 PM

Seymur Hasanov

The repertoire of materials available to engineers today and embodied in engineering systems includes tens of thousands of different materials, as well as naturally occurring ones. This course addresses why specific materials are selected for particular applications and the rational basis for their selection. The course is intended to serve as an introduction to the principles and methodology of selecting materials for engineering components based on the functionality and purpose of the component in different system applications and operating environments. The selection specification includes satisfying a variety of objectives, such as minimizing weight, cost (financial as well as environmental), end of life recycling and material scarcity.

Advanced Engineering Quantum Mechanics

MW 0300 PM - 0415 PM

Marko Loncar

The focus of this course is on the basic principles involved in the control of quantum systems and assumes knowledge of undergraduate quantum mechanics. Schrödinger, Heisenberg and interaction representations. Eigenvalue and time dependent problems, wave packets, coherent states. Harmonic oscillators. Quantization of the EM field. Tunneling; periodic potentials; Bloch's theorem. Perturbation theory. WKB approximation. Transfer matrix methods. Variational methods. Rotation generators and angular momentum. Magnetic moment and spin; Stern Gerlach experiment. Spin states, Pauli matrices. Pauli equation. Dynamics of spins in a static and a transverse time dependent magnetic field; dynamics in a rotating frame; Rabi oscillations. Coherent dynamics of two-level atoms. Rotating-wave and dipole approximations. Mixed states and density matrix. T1 and T2 relaxation times. Bloch equations. Identical particles: Bosons and Fermions. Slater determinant. Entanglement; singlet and triplet states. Hydrogen molecule. Clebsch-Gordan coefficients. Exchange energy. Elements of quantum information (qubits, no-cloning theorem, teleportation, quantum circuits).

Course Note: This course is also offered as QSE 200 and Chem 200. Students may only take one of ENG-SCI 200, QSE 200, and Chem 200 for credit. Taking this course meets the quantum mechanics core course requirement for Applied Physics.

FAS Divisional Distribution: Science & Engineering & Applied Science

Decision Theory

TR 1115 AM - 1230 PM

Instructor Permission Required

Demba Ba

ES 201/AM 231 is a course in statistical inference and estimation from a signal processing perspective. The course will emphasize the entire pipeline from writing a model, estimating its parameters and performing inference utilizing real data. The first part of the course will focus on linear and nonlinear probabilistic generative/regression models (e.g. linear, logistic, Poisson regression), and algorithms for optimization (ML/MAP estimation) and Bayesian inference in these models. We will pay particular attention to sparsity-induced regression models, because of their relation to artificial neural networks, the topic of the second part of the course. The second part of the course will introduce students to the nascent and exciting research area of model-based deep learning. At present, we lack a principled way to design artificial neural networks, the workhorses of modern AI systems. Moreover, modern AI systems lack the ability to explain how they reach their decisions. In other words, we cannot yet call AI explainable or interpretable which, as a society, poses important questions as to the responsible use of such technology. Model-based deep learning provides a framework to develop and constrain neural-network architectures in a principled fashion. We will see, for instance, how neural-networks with ReLU nonlinearities arise from sparse probabilistic generative models introduced in the first part of the course. This will form the basis for a rigorous recipe we will teach you to build interpretable deep neural networks, from the ground up. We will invite an exciting line up of speakers. Time permitting, we will provide a model-based perspective of the building blocks of modern language and image generative models.

Course Note: Engineering Sciences 201 is the same as Applied Mathematics 231. Students may not take both for credit.

Applied Mathematics 21a,b or Mathematics 21a,b, and Statistics 110 or equivalents.

FAS Divisional Distribution: Science & Engineering & Applied Science

Learning, Estimation, and Control of Dynamical Systems

MW 0945 AM - 1100 AM

Na Li

This graduate level course studies dynamic systems in time domain with inputs and outputs. Students will learn how to design estimator and controller for a system to ensure desirable properties (e.g., stability, performance, robustness) of the dynamical system. In particular, the course will focus on systems that can be modeled by linear ordinary differential equations (ODEs) and that satisfy time-invariance conditions. The course will introduce the fundamental mathematics of linear spaces, linear operator theory, and then proceeds with the analysis of the response of linear time-variant systems. Advanced topics such as robust control, model predictive control, linear quadratic games and distributed control will be presented based on allowable time and interest from the class. The material learned in this course will form a valuable foundation for further work in systems, control, estimation, identification, detection, signal processing, and communications.

Course Note: Engineering Sciences 202 is also offered as Applied Mathematics 232. Students may not take

both for credit.

Linear algebra, differential equations, and signals and systems (AM 120, ES 156, or equivalent). Undergraduates need permission.

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 215

Physical and Economical Operations of Sustainable Energy Systems

TR 1115 AM - 1230 PM

Le Xie

This course introduces graduate students to operational issues in sustainable electric energy systems. The first part covers basic electrical engineering, optimization, and economic concepts. The second part examines the "modular" view of energy processing components (e.g., generators, transmission network, demands). The third part explores physical and market operations in the evolving electricity industry. Computer-based demos and homework will help students understand key concepts relevant to the power industry.

ENG-SCI 222

Advanced Cellular Engineering

TR 1115 AM - 1230 PM

Kit Parker

This is a combined introductory graduate/upper-level undergraduate course that focuses on examining modern techniques for manipulating cellular behavior and the application of these techniques to problems in the biomedical and biotechnological arenas. Applications in drug discovery, regenerative medicine, and cellular agriculture will be discussed. Topics will include controlling behavior of cells through cell-matrix interactions, cytoskeletal architecture, and cell behavior in processes such as angiogenesis and wound healing. Lectures will review fundamental concepts in cell biology before delving into topical examples from current literature. Students will work weekly in the lab learning cell culture techniques, soft lithography, microscopy, and classical in vitro assays measuring cell behavior.

Course Note: BE121 and ES222 are the same course. This course has a mandatory laboratory section that will require hands-on work outside of scheduled lecture times.

Course ID: 114808
2025 Fall (4 Credits)

Instructor Permission Required

Inorganic chemistry, cell biology, physics, and mathematics at the level of Applied Mathematics 21 or Mathematics 21. Suggested courses include organic chemistry and molecular biology.

ENG-SCI 225

Neuroengineering

Course ID: 216799

2025 Fall (4 Credits)

TR 1245 PM - 0200 PM

Instructor Permission Required

Jia Liu

This course provides an introduction to biological neural systems, and current engineering efforts to understand, control, and enhance the function of neural systems. The focus is on the basic knowledge of molecular basis, anatomic structures, and electrical functions of central and peripheral nervous systems, and the most state-of-the-art genetic/genomic, optical, electrical, magnetic, and computational tools for nervous systems. Key themes throughout the course will include structures of central and peripheral nervous systems, genetic engineering, RNA sequencing, optogenetics, microscope, bioelectronics, MRI, and computational neuroscience. This includes both the practical and theoretical aspects of the topic.

Course Note: The contents and course requirements are similar to those of Biomedical Engineering 131 (BE 131), with the exception that students enrolled in Engineering Sciences 225 (ENG-SCI 225) are expected to undertake a substantial course project.

This course is intended for juniors and seniors with some background in biology or engineering. ENG-SCI 54 and one life science course are recommended.

ENG-SCI 239

Advanced Innovation in Science and Engineering: Conference Course

TR 0130 PM - 0245 PM

David Ricketts

Course ID: 118942

2025 Fall (4 Credits)

This class integrates perspectives from leading innovators with collaborative practice and theory of innovation to teach and inspire you to be more innovative in your life and career. Our approach is to engage with leaders and learn their perspectives and align this with innovation sprints where you learn the best tools, processes, and methods to innovate. You can see a course overview here <https://youtu.be/CqfvXf33TCE>. Find out more information on Instagram @engsci139 or <https://www.instagram.com/engsci139/Students> are expected to meet all the requirements of Engineering Sciences 139 and in addition are required to prepare an individual term project with significant analytic emphasis in an area of scientific or technological innovation.

Course Note: May not be taken for credit if ENG-SCI 139 already complete. Offered jointly with the Graduate School of Design as SCI-6272.

The course will be taught in two sessions per week, each with a different focus. One session will focus on Innovation Perspective and often will contain guest lectures by innovators. The second session will focus on Innovation Practice and will contain interactive group work, case studies, and other educational formats about specific innovation ideas and tools. These may be taught on different days or both days, with first-half Perspective and second-half Practice.

The course will be held in person. Some classes may be held at alternative times depending on the schedule of guest speakers.

Mathematics of High-Dimensional Information Processing and Learning

2025 Fall (4 Credits)

TR 1200 PM - 0115 PM

Instructor Permission Required

Yue Lu

This course introduces students to fundamental results and recently developed techniques in high-dimensional probability theory and statistical physics that have been successfully applied to the analysis of information processing and machine learning problems. Discussions will be focused on studying such problems in the high-dimensional limit, on analyzing the emergence of phase transitions, and on understanding the scaling limits of efficient algorithms. This course seeks to start from basics, assuming just a solid understanding of undergraduate probability theory. Students will take an active role by exploring and applying what they learn from the course to their own research problems.

Course Note: Engineering Sciences 254 is also offered as Applied Mathematics 254. Students may not take both for credit.

Analysis (Math 21a/b, or equivalent), Probability (Statistics 110, Engineering Sciences 150, or equivalent), and Programming (Python, Julia, or Matlab).

ENG-SCI 257

Course ID: 223997

Semidefinite Optimization and Relaxation

2026 Spring (4 Credits)

MW 0215 PM - 0330 PM

Heng Yang

This course teaches the theory, computation, and applications of semidefinite optimization and relaxation, a paradigm that leverages convex semidefinite programming (SDP) for approximately (and sometimes exactly) solving nonconvex optimization and decisionmaking problems. The theoretical focus will be the celebrated moment and sums-of-squares (SOS) hierarchy, its sparse variants, and its extensions to min-max optimization. The computational focus will be numerical algorithms for solving SDPs, such as interior-point methods and more recent low-rank solvers. Applications from applied mathematics, control, computer vision, and robotics are used to illustrate the practical usefulness of the theory and algorithms.

Familiarity with linear algebra (at the level of Math 21b), probabilistics, calculus, and basic programming (Matlab, Python etc). It is recommended to have basic knowledge about convex optimization (e.g., CS 128), and control and robotics (e.g., ES/AM 158), though this is not strictly necessary.

FAS Divisional Distribution: Science & Engineering & Applied Science

Introduction to Bioelectronics

TR 1245 PM - 0200 PM

*Instructor Permission Required**Jia Liu*

This course introduces bioelectronics and its applications in neuroscience, neuroengineering, cardiology, wearable technology, and so on. The focus is on the basic principles of bioelectricity, biochemistry, and physiological behaviors of biological systems and how to design electronic tools to precisely measure and control them. Key themes throughout the course will include bioelectricity, biochemistry, cellular and tissue physiological behavior, optogenetics, sensors, stimulators, circuits, signal processing, electronics-biology interface, and applications. This includes both the practical and theoretical aspects of the topic. Three experimental demonstrations will be included as part of the normal class meeting time. Given its broad coverage, students who enroll in this course are expected to have a substantial background in chemistry, biology, and electrical engineering (see recommended prep and course requirements). The contents and course requirements are similar to those of Biomedical Engineering 129 (BE 129), with the exception that students enrolled in Engineering Sciences 258 (ENG-SCI 258) are expected to undertake a substantial course project.

Course Note: The total enrollment limit for BE 129 and ES 258 is 20 students.

ENG-SCI 50, ENG-SCI 52, or ENG-SCI 152.

FAS Divisional Distribution: Science & Engineering & Applied Science

Advanced Introduction to Robotics

TR 1115 AM - 1230 PM

Robert D. Howe

Introduction to computer-controlled robotic manipulators. Topics include coordinate frames and transformations, forward and inverse kinematic solutions to open-chain manipulators, the Jacobian, dynamics and control, and motion planning. In addition, special topics will be introduced such as computer vision, soft robotics, surgical robots, MEMS and microrobotics, and biomimetic systems. Laboratory exercises will provide experience with industrial robot programming and robot simulation and control.

Course Note: Laboratory will be scheduled after classes begin, based on students' and course staff's availability. Eng-Sci 259 is also listed as Eng-Sci 159. Students may not take both for credit. Graduate students must enroll in 259. The material in 259 is the same as in 159, but with additional problems on the problem sets and a final project. Jointly offered at GSD as SCI 6274.

**Linear algebra and multivariable calculus: matrix operations, positive definiteness of a matrix, determinants, complex numbers, eigenvalues and eigenvectors, partial derivatives and integration (e.g., Mathematics 21a,b, Mathematics 22a,b, Mathematics 25a,b, Applied Mathematics 22a,b). *Introductory mechanics: free-body diagrams with masses, springs, and dampers, vector forces and vector torques (e.g., Physics 15a, Physics 16, Physical Sciences 12a, Applied Physics 50a,b). *Programming experience (e.g., CS 50; MATLAB recommended).*

FAS Divisional Distribution: Science & Engineering & Applied Science

Environmental Modeling and Data Analysis

TR 0130 PM - 0245 PM

Steven Wofsy

Graduate-level introduction to environmental modeling and data analysis: data visualization, statistical inference, Bayes Theorem, optimal estimation, adjoint methods, Monte Carlo methods, time series analysis, denoising; principles and numerical methods for chemical transport and inverse models.

Course Note: Focused on computer-based projects. Suitable for: graduate students and advanced undergraduates in Earth and Planetary Sciences, Environmental Science and Engineering, Applied Math, Chemistry, and Physics. At MIT: EAPS, Civil & Environmental. Helpful to have preparation in differential equations, or atmospheric science, but not required. This course is also offered as EPS 236. Students may not take both for credit.

Applied Mathematics 105; a course in atmospheric chemistry (EPS/ESE 133 or EPS 200/ESE 260 or equivalent); or permission of the instructors.

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 268

Physics of Climate

TR 1030 AM - 1145 AM

Zhiming Kuang

Overview of the basic features of the climate system (global energy balance, atmospheric general circulation, ocean circulation, and climate variability) and the underlying physical processes.

Course Note: This course includes a one-time computer lab to be arranged. This course is also offered as EPS 208. Students may not take both for credit.

Applied Mathematics 105 (may be taken concurrently); Physics 15 or Physical Sciences 12a,b; or permission of the instructor.

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 273

Optics and Photonics

MW 0300 PM - 0415 PM

Federico Capasso

The focus is on the foundations of optics/photonics and on some of its most important modern developments and applications. Powerful and widely used computational tools will be developed in the sections. Topics to be covered: Maxwell's equations, Free space optics. Reflection, refraction, polarization (Jones Calculus and Stokes parameters); interference and diffraction. Light-matter interaction, dispersion and absorption. Guided wave optics (including optical fibers). Perturbation and couple mode theory, transfer matrix methods; numerical methods. Optical resonators. Photonic crystals. Near-field optics. Metal optics and Plasmonics. Metamaterials and Metasurfaces.

Course Note: Open to graduate students and advanced undergraduates.

Elements of Electromagnetism, such as taught in Applied Physics 50b, Physics 15b, Physical Sciences 12b, Engineering Sciences 151 or equivalent.

FAS Divisional Distribution: Science & Engineering & Applied Science

ENG-SCI 275

Integrated Nonlinear Photonics

MW 0900 AM - 1015 AM

Kiyoul Yang

This course will discuss electro-optics and nonlinear physics in nanophotonic devices. Topics include key building blocks of integrated photonics such as interferometers, microresonators, Bragg gratings, and photonic crystals; device physics and design of silicon photonics-based electro-optic modulators; second-order nonlinear photonics including parametric oscillation/ amplification, electro-optic modulation/ combs, harmonic generation, quasi-phase matching, and frequency mixing; third-order nonlinear photonics including supercontinuum generation, parametric oscillation, soliton frequency combs, and techniques for dispersion engineering and pulse shaping; Brillouin lasing and Raman scattering.

Designing Technology Ventures

MW 0350 PM - 0510 PM

Robert D. Howe, George Clay

This is a core course in the MS/MBA: Engineering Sciences Program. Launching a successful startup requires a business model that defines the venture's customer value proposition; plans for technology, operations, and marketing; and a formula for eventually earning profit. Students will learn how to design business models that address challenges that technology ventures frequently encounter as they grow and evolve. We will employ system dynamics modeling using simulation software to inform those business model design choices. A team project will investigate business model options for an early-stage startup.

Course Note: Enrollment is limited to second-year students in the MS/MBA: Engineering Sciences program.

Requires: First year MS/MBA students only

FAS Divisional Distribution: None

Course ID: 208004
2025 Fall (4 Credits)

ENG-SCI 285

Design Theory and Practice

No meeting time listed

Elizabeth Christoforetti, Roberto Verganti

Any organization, business or venture grounds its value on how "meaningful" are its products (functionally, symbolically and emotionally). Design Theory and Practice (DTP) empowers students to create products that are meaningful, to people who use them and to society at large. The course has three purposes: 1. To inspire students about the power of design in new business creation. We will address questions such as: Why is design relevant in tech ventures? How does it create value? And, most of all, why is it fundamental for a technology entrepreneur/leader? 2. To enable them to move into action, by learning the theories and practice (mindsets, processes, methods) of design: Where do ideas come from? How to frame (and especially re-frame) a problem? How to understand what is meaningful to users? How to make a product desirable (functionally, emotionally and symbolically)? How to design and build the user interface of a product? How to test it? How to narrate and visualize a novel idea? 3. To co-explore, with the class and the instructor, the use of design as a leadership

Course ID: 212920
2025 Fall (4 Credits)

Instructor Permission Required

practice: How does a leader who masters design can better contribute to creation of value? How can we forge a new manifesto for leadership, inspired by design?The course is intensively project-based. Students will work in teams on a complex innovation challenge proposed by a real corporation. They will suggest a more effective framing of the problem, and create a novel meaningful solution, with a special focus on the user interface.

Course Note: This course is limited to MS/MBA: Engineering Sciences students only. Requires instructor consent.

ENG-SCI 292A

Launch Lab/Capstone 1

No meeting time listed

Russell J Wilcox, Alan Maccormack

Course ID: 214579

2026 Spring (4 Credits)

Instructor Permission Required

The MS/MBA Capstone is an intensive project that requires teams of students to apply and integrate the skills they have learned across core disciplines developed in the program curriculum. Specifically, teams will be expected to design, build and launch a new technology-based product/service venture, and thereby to demonstrate mastery with respect to three areas of knowledge: Design Knowledge: The use of human-centered design methods to understand users, identify solutions to their needs, and gather feedback via rapid, iterative prototyping. Technical Knowledge: The use of rigorous system engineering methods to plan, design, develop, build, and test a complex technology-based product/service, integrating knowledge across multiple engineering disciplines. Business Knowledge: The use of business model analysis and lean experimentation methods to develop and test a set of hypotheses that capture how the new product/service will create value, including business model design, pricing, sales and marketing, operating model and profit formula. The Capstone is divided into two parts, the first of which is an immersive course completed during the January term of the G2 year (Capstone I). The subsequent spring course (Capstone II) follows on from and builds upon work completed in January. Given students prior coursework, a working knowledge of human-centered design methods, systems engineering techniques, and business modeling and lean experimentation is assumed. Launch Lab therefore focuses on the practical application of these skills to team projects, supplemented by content in three areas: i) seminars on advanced methods and techniques, ii) workshops that demonstrate how to put these skills and tools into practice, and iii) guest speakers who share their experience in the areas of design, technology and business.

Course Note: Open to MS/MBA: Engineering Sciences students only, or to others by permission of the instructor.

Given students prior coursework, a working knowledge of human-centered design methods, systems engineering techniques, and business modeling and lean experimentation is assumed. Launch Lab therefore focuses on the practical application of these skills to team projects, supplemented by content in three areas: i) seminars on advanced methods and techniques, ii) workshops that demonstrate how to put these skills and tools into practice, and iii) guest speakers who share their experience in the areas of design, technology and business.

Course Note: Open to MS/MBA: Engineering Sciences students only, or to others by permission of the instructor.

ENG-SCI 293

Cryo-Electron Microscopy for Biological and Soft Materials Lecture/Lab

M 0130 PM - 0245 PM

David Bell

Course ID: 205078

2025 Fall (4 Credits)

Instructor Permission Required

This class covers the fundamental principles underlying cryo-electron microscopy applied to Biological and SoftMaterials starting with the basic anatomy of electron microscopes, an introduction to Fourier transforms, and the principles of image formation. Building upon that foundation, the class then covers the sample preparation issues, data collection strategies, and basic image processing workflows.

First-year-level math, physics (biochemistry preferred optional).

ENG-SCI 294

Humanity and its Futures: AI and Human Cognition

T 0945 AM - 1230 PM

Fawwaz Habbal

Course ID: 226030

2026 Spring (4 Credits)

Instructor Permission Required

This course provides students with an understanding of the complexities surrounding today's most intractable problems and helps them develop methodologies for navigating the challenges they will face. After introducing systems thinking, with a focus on interconnections and feedback loops, the course will address a significant interdisciplinary issue: Artificial Intelligence (AI) and its relationship to human cognition. The study of AI and human cognition is both timely and dynamic. This expansive domain integrates computer science, statistics, big data, cognitive science, psychology, and philosophy. As a transformative technology, AI has achieved remarkable success in understanding natural language and emulating human reasoning, making it invaluable in augmenting human cognition. Despite these advances, many questions remain about the nature of AI and its relationship with human thought. This course invites participants to explore these questions through an intellectual journey. Students will engage in discussions on systems and paradigms, the essence of intelligence, computational approaches, mind and machine metaphors, cognitive biases in AI, and the role of AI in creativity and intuition. The course emphasizes collaborative learning, with students working in teams to learn from each other, as well as from lectures and selected literature. Each lecture will be paired with research papers and books, followed by a discussion session. The topics covered in the course are listed in the syllabus. Each will include an overview of the issue and its significance. Students will apply systems thinking and a multidisciplinary approach to analyze and critique each topic. By the end of the course, students will have developed a strong framework for multidisciplinary discussions, gained a deep understanding of AI's power, limitations, and risks, and explored its technical building blocks through hands-on exercises. Additionally, students will experience the value of collaboration and the importance of diversity while working in diverse teams.

Course Note: ES 294 (for graduate students) is also offered as ES 26. Students may not take both for credit. The combined cap for ES 26 and ES 294 is 25 students.

Professional Writing for Scientists and Engineers

R 0300 PM - 0500 PM

Suzanne Smith

Course ID: 207614

2025 Fall (4 Credits)

Instructor Permission Required

This class leads students to develop their skills in the critical reading and writing of science and engineering. Genres will include research articles, grant proposals, school/fellowship/job applications, or lay abstracts & press releases for the non-scientific public. Crucially, students will be empowered not only to achieve their own writing goals, but also to break down these learned skills and impart them to others, as effective collaborators and mentors of younger students.

Methodologies in Design Engineering

F 0945 AM - 1230 PM

Kit Parker

Course ID: 213398

2026 Spring (4 Credits)

Instructor Permission Required

This is a SAT/UNSAT seminar course focused on design thinking, analysis, planning, and executing the development of engineered systems. Weekly meetings will include discussions and assigned readings of case studies and examples of the systems surrounding the developing technical system. Organizing and executing research, innovation, and product design at the scales from academic group, to startup, to major industry will be discussed. The course is designed to allow the engineer and designer to integrate technical knowledge into an executable framework as an individual or leader of a design team.

Course Note: Enrollment subject to approval of the instructor, with first and second year MDE graduate students receiving priority. Undergraduates are not allowed to enroll.

Scot Martin

Experimental or theoretical research project on acceptable problems in engineering and applied science supervised by a SEAS faculty member, and/or supervised reading on topics not covered by regular courses of instruction. The project or reading must be arranged between the student and individual SEAS faculty supervisor prior to enrolling in the course.

Course Note: Open to graduate students and AB/SM candidates only. In addition to enrolling in my.harvard, enrollees must file a 299r Special Topics Form approved by the SEAS faculty supervisor of the project before the course registration deadline. AB/SM students must obtain CHD approval for this course to count toward their SM requirements, and the course must be allocated accordingly in the student's record with the Registrar; it cannot be used towards also meeting AB degree requirements. The form may be obtained at <https://www.seas.harvard.edu/office-academic-programs/graduate-policies-procedures-and-forms/graduate-student-forms>. The Art of Criticism

No meeting time listed

Margaret Doherty

Course ID: 222534
2026 Spring (4 Credits)

Instructor Permission Required

This course will consider critical writing about art—literary, visual, cinematic, musical, etc.—as an art in its own right. We will read and discuss criticism from a wide variety of publications, paying attention to the ways outlets and audience shape critical work. The majority of our readings will be from the last few years and will include pieces by Joan Acocella, Andrea Long Chu, Jason Farago, and Carina del Valle Schorske. Students will write several short writing assignments (500-1000 words), including a straight review, during the first half of the semester and share them with peers. During the second half of the semester, each student will write and workshop a longer piece of criticism about a work of art or an artist of their choosing. Students will be expected to read and provide detailed feedback on the work of their peers. Students will revise their longer pieces based on workshop feedback and submit them for the final assignment of the class.

ENGLISH CAKN

Fiction Workshop: The Short Novel

T 0900 AM - 1145 AM

Andrew Krivak

Course ID: 226477
2025 Fall (4 Credits)

Instructor Permission Required

This course is a workshop intended for students who are interested in exploring the form of the short novel, or the "novella." The short novel is not simply a novel with fewer pages. The short novel understands and develops character and conflict, time and plot, and often setting and stage in ways unique to its particular scope, characters, and intent. We will read seven short novels in this course: Joseph Conrad's *Heart of Darkness* (to be read before the first meeting); Norman Maclean's *A River Runs Through It*; Annie Ernaux's *Happening*; Denis Johnson's *Train Dreams*; Claire Keegan's *Small Things Like These*; Jon Fosse's *Aliss at the Fire*; and Juan Rulfo's *Pedro Páramo*. Separately and collectively, we will ask of these works: What is the form, and how is the form realized in the arc of the narrative? Primarily, however, students will write. Our goal will be to have a student's work read and discussed twice in class during the semester. I am hoping to see 40 to 50 pages of a short novel—at any level of completion—by the end of term.

Admission by application only. For information on specific application requirements and instructions, please see the full course listing on the English Department website. DEADLINE: for all Fall 2025 workshops, applications

will open by March 24 and are due via Submittable by 11:59pm on Sunday, April 6. Students will be notified of admissions decisions by 5:00pm ET on Thursday, April 10, and must accept/claim their seats within 24 hours. Workshops will meet the first week of classes.

Advanced Screenwriting: Workshop

No meeting time listed

Musa Syeed

Course ID: 123934
2026 Spring (4 Credits)

Instructor Permission Required

The feature-length script is an opportunity to tell a story on a larger scale, and, therefore, requires additional preparation. In this class, we will move from writing a pitch, to a synopsis, to a treatment/outline, to the first 10 pages, to the first act of a feature screenplay. We will analyze produced scripts and discuss various elements of craft, including research, writing layered dialogue, world-building, creating an engaging cast of characters. As an advanced class, we will also look at ways both mainstream and independent films attempt to subvert genre and structure. Students will end the semester with a first act (20-30 pages) of their feature, an outline, and strategy to complete the full script.

Advanced Playwriting: Workshop

No meeting time listed

Sam Marks

Course ID: 145402
2026 Spring (4 Credits)

Instructor Permission Required

This workshop is a continued exploration of writing for the stage, with an eye towards presentation. The semester will culminate in a staged reading of each student's work for the Harvard Playwrights Festival. Each reading will be directed by a professional director and presented to the public. Students will be encouraged to excavate their own voice in playwriting and learn from the final presentation. The class will examine the design of the stage, the playworld, and the page. Students will attempt multiple narrative strategies and dialogue techniques. They will bolster their craft of playwriting through generating short scripts and a completed one act. Readings will include significant contributors to the theatrical form such as Caryl Churchill and Samuel Beckett as well as contemporary dramatists such as Annie Baker, Jackie Sibbles Drury, Branden Jacobs Jenkins, and Jeremy O. Harris.

Blood, Sweat, Tears: The Art and Craft of Horror Writing

R 1200 PM - 0245 PM

William White

Course ID: 220138

2025 Fall (4 Credits)

Instructor Permission Required

This is a fiction workshop for those who are interested in the art and craft of horror literature. In this class, we will learn how other writers have frightened readers with the demonically-willed word and use this knowledge to create our own tales of the macabre. We often create fantastical horrors to help us cope with the very real ones of our everyday lives. In that spirit, the kind of horror we will study and write in this workshop will not be interested in cheap thrills and schlocky gore alone. We will also plumb the depths of what frightens us to better understand ourselves and each other. Authors whose work we will study include: Mariana Enríquez, Samanta Schweblin, Stephen Graham Jones, and Victor LaValle. This workshop is open to both beginning and advanced writers of fiction.

Admission by application only. For information on specific application requirements and instructions, please see the full course listing on the English Department website. DEADLINE: for all Fall 2025 workshops, applications will open by March 24 and are due via Submittable by 11:59pm on Sunday, April 6. Students will be notified of admissions decisions by 5:00pm ET on Thursday, April 10, and must accept/claim their seats within 24 hours. Workshops will meet the first week of classes.

2025 Fall (4 Credits)

Instructor Permission Required

Julio Cortázar: "The fantastic breaks the crust of appearance ... something grabs us by the shoulders to throw us outside ourselves." This workshop will explore the art of writing literature that unsettles our understanding of reality, that splits open the world as we know it, allowing us to encounter new possibilities. The initial weeks will focus on exploratory exercises and the study of published short stories and craft essays. Later, student work will become the primary text as the focus shifts to workshop discussion. Authors on the syllabus will likely include Julio Cortázar, Jorge Luis Borges, Angela Carter, Aoko Matsuda, Helen Oyeyemi, and Octavia Butler. This workshop welcomes writers of all levels of experience.

Admission by application only. For information on specific application requirements and instructions, please see the full course listing on the English Department website. DEADLINE: for all Fall 2025 workshops, applications will open by March 24 and are due via Submittable by 11:59pm on Sunday, April 6. Found Poems, Erasures and Other Adventures in Documentary Poetry

W 1200 PM - 0245 PM

Tracy K. Smith

Course ID: 218757

2025 Fall (4 Credits)

Instructor Permission Required

In their quest for clarity, revelation and consolation, poets engage with, reflect upon and speak back to the world in a range of ways. In pursuit of these very same aims, poets also listen closely to what has already been said by others at registers spanning intimate exchange, public discourse and sacred utterance. In this poetry workshop, we'll engage in an exploration of found materials—letters, news articles, historical texts, police reports, instruction manuals and more—to see what new forms of dialogue they might invite, and what light they might shed upon the questions, concerns and apprehensions of our current time. With readings by Reginald Dwayne Betts, Robin Coste Lewis, Solmaz Sharif, Jay Bernard and others.

Admission by application only. For information on specific application requirements and instructions, please see the full course listing on the English Department website. DEADLINE: for all Fall 2025 workshops, applications will open by March 24 and are due via Submittable by 11:59pm on Sunday, April 6. Poetry Workshop: Form & Content

M 1200 PM - 0245 PM

Tracy K. Smith

Course ID: 218756

2025 Fall (4 Credits)

Instructor Permission Required

In this workshop, we'll look closely at the craft-based choices poets make, and track the effects they have upon what we as readers are made to recognize, remember and feel. How can implementing similar strategies better prepare us to engage the questions making up our own poetic material? We'll also talk about something that, surprisingly enough, doesn't always get a lot of air-time in the workshop: content. What can poetry reveal about the ways our interior selves are shaped by public realities like race, class, sexuality, injustice and more? And what can vigilant attention to craft do to inform and enhance such considerations? This course will proceed as part seminar, part workshop. We will devote roughly one-third to one-half of each session to the discussion of published poems, and the rest to the critique of student work. Beginning in Week 2, take-home writing exercises will be collected from all students.

Admission by application only. For information on specific application requirements and instructions, please see the full course listing on the English Department website. DEADLINE: for all Fall 2025 workshops, applications will open by March 24 and are due via Submittable by 11:59pm on Sunday, April 6. Students will be notified of admissions decisions by 5:00pm ET on Thursday, April 10, and must accept/claim their seats within 24 hours. Workshops will meet the first week of classes.

ENGLISH CFE

Advanced Fiction

No meeting time listed

Indraneel Mukherjee

Course ID: 220419

2026 Spring (4 Credits)

Instructor Permission Required

The course will consist of two halves. In the first hour of each class, we will be doing close readings/literary-critical analyses of an assigned text (see below, 'Course Schedule', for all the reading material for the semester), with the aim of isolating some aspect of the craft of writing in order to take bearings for your own. We will be looking at technical things such as point of view, free indirect discourse, narration, character, interiority, style, movement, affect, but also at broader issues: metaphysics, politics, inequality, race, colonialism/imperialism, the white gaze. You will not only have read the assigned text with critical rigor but also taken notes of the points you want to raise in class. While I do not expect you to hand in short critical essays on the texts, I will be looking for engaged, alert discussions, so it may help to have something written down to facilitate our conversations. Please note: Reading the assigned text is obligatory. Previous Creative Writing workshop experience is desirable. If you're writing YA fantasy, there are other courses on offer that would be a better fit. In the second half of the class, divided into two equal segments of 55 minutes each, we will be workshoping the writing of two students. To this end, every week two students will hand in something they have written, to the tune of 2,500-5,000 words, to me and to everyone in the group, ideally one week before their turn. At our first meeting, I will circulate a rota for you to put down your names and walk you through the syllabus, the aims and objectives of the course, workshop rules, expectations, requirements etc. For our first workshoping session, two students should hand in work five to seven days before. Our goal is for each of you to have two turns, and approximately 5-10,000 words of your work critiqued, by the time semester ends. Copies of these writing samples will be returned to you at the end of each workshop with comments from me and from everyone in class. Work submitted must be single-sided, double-spaced, paginated and, ideally, bearing a title. It must have your name on it and, on the top right-hand corner of the first page, my name and 'Advanced Fiction, Spring 2026'.

Flash Fiction: Writing and Workshoping the Very Short Story

W 1200 PM - 0245 PM

William White

Course ID: 226382

2025 Fall (4 Credits)

Instructor Permission Required

How can we tell a compelling story in under three pages, or in one page, or perhaps in just a single sentence? In this workshop, we will explore the genre of flash fiction: stories that are small in size, but grand in ambition. This is a fiction workshop for those who are unabashed sentence-lovers. We will look closely at syntax, at word choice, and, yes, even at grammar and punctuation to uncover what pleasures and mysteries the well-crafted sentence can provide to our readers. We will also consider what we don't include on the page and how we can use this "blank space" to imply larger, more complex narratives. Students will write and workshop several flash fictions throughout the semester. We will also read and study writers who have excelled at the form, including Grace Paley, Diane Williams, Lydia Davis, Peter Orner and more. This workshop is open to both beginning and advanced writers.

Admission by application only. For information on specific application requirements and instructions, please see the full course listing on the English Department website. DEADLINE: for all Fall 2025 workshops, applications will open by March 24 and are due via Submittable by 11:59pm on Sunday, April 6. Students will be notified of admissions decisions by 5:00pm ET on Thursday, April 10, and must accept/claim their seats within 24 hours. Workshops will meet the first week of classes.

Introduction to Playwriting: Workshop

T 1200 PM - 0245 PM

Sam Marks

Course ID: 116875

2025 Fall (4 Credits)

Instructor Permission Required

This workshop is an introduction to writing for the stage through intensive reading and in-depth written exercises. Each student will explore the fundamentals and possibilities of playwriting by generating short scripts and completing a one act play with an eye towards both experimental and traditional narrative styles. Readings will examine various ways of creating dramatic art and include work from contemporary playwrights such as Ayad Akhtar, Clare Barron, Aleshea Harris, Young Jean Lee, Taylor Mac, and Sanaz Toossi as well established work from Edward Albee, Caryl Churchill, Suzan Lori-Parks, and Harold Pinter.

Course Note: TDM CKR is the same course as ENGLISH CKR.

Admission by application only. For information on specific application requirements and instructions, please see the full course listing on the English Department website. DEADLINE: for all Fall 2025 workshops, applications will open by March 24 and are due via Submittable by 11:59pm on Sunday, April 6. Students will be notified of admissions decisions by 5:00pm ET on Thursday, April 10, and must accept/claim their seats within 24 hours.

Workshops will meet the first week of classes.

Getting the Words Right: The Art of Revision

2026 Spring (4 Credits)

No meeting time listed

Instructor Permission Required

Laura van den Berg

A promising draft is of little use to us as writers if we have no idea what to do next, of how to begin again. This course aims to illuminate how revision can be every bit as creative and exhilarating as getting the first draft down—and how time spent re-imagining our early drafts is the ultimate show of faith in our work. We will explore the art of revision—of realizing the promise of that first draft—through reading, craft discussion, exercises, and workshop. Students can expect to leave the semester with two polished short stories (or 40-50 polished novel pages), a keener understanding of their own writing process, and a plan for where to take their work next. It will be helpful to enter into the semester with some pre-existing material that you wish to revise (a short story, several chapters of a novel). Previous experience with workshoping writing is encouraged but not required.

Play and Games: The Art of Sportswriting

2026 Spring (4 Credits)

No meeting time listed

Instructor Permission Required

Louisa Thomas

In newsrooms, the sports section is sometimes referred to as the "toy department" -- frivolous and unserious, unlike the stuff of politics, business, and war. In this course, we will take the toys seriously. After all, for millions of people, sports and other so-called trivial pursuits (video games, chess, board games, and so on) are a source of endless fascination. For us, they will be a source of stories about human achievements and frustrations. These stories can involve economic, social, and political issues. They can draw upon history, statistics, psychology, and philosophy. They can be reported or ruminative, formally experimental or straightforward, richly descriptive or tense and spare. They can be fun. Over the course of the semester, students will read and discuss exemplary profiles, essays, articles, and blog posts, while also writing and discussing their own. While much (but not all) of the reading will come from the world of sports, no knowledge about sports is required; our focus will be on writing for a broad audience.

Introduction to Screenwriting: Workshop

2025 Fall (4 Credits)

T 1200 PM - 0245 PM

Instructor Permission Required

Musa Syeed

The short film, with its relatively lower costs of production and expanded distribution opportunities, has become one of the most disruptive, innovative modes of storytelling--and is often an emerging filmmaker's first step into a career. This course will introduce students to the basics of short form screenwriting, including narrative theory/structure, character design, and dialogue/voice. In the first quarter of the semester, we will hone dramatic techniques through several craft exercise assignments and in-class writing. In the following weeks, students will write two short screenplays. Throughout the semester, we will be workshoping and doing table reads of student work, discussing screenplays and craft texts, and screening a wide array of short films. The emphasis will be on discovering a sense of personal voice and completing two short screenplays (under 20 pages).

Admission by application only. For information on specific application requirements and instructions, please see the full course listing on the English Department website. DEADLINE: for all Fall 2025 workshops, applications will open by March 24 and are due via Submittable by 11:59pm on Sunday, April 6. Students will be notified of admissions decisions by 5:00pm ET on Thursday, April 10, and must accept/claim their seats within 24 hours. Workshops will meet the first week of classes.

Creative Nonfiction Workshop: Comedy and Creative Nonfiction

R 1200 PM - 0245 PM

*Instructor Permission Required**Melissa Cundieff*

In this workshop-based class, students will be asked to use humor as the bedrock of their creative nonfiction writing. Humor connects us as human beings and creates and sustains attention and trust from our readers. You will write three nonfiction essays in this class, and the topics that you touch on may well be dark or difficult; this is up to you. Humor is often a means to navigating, inverting, and confronting our sadder and most challenging life stories. As I see it, making people laugh is an intellectual exercise in empathy as much as it is an exercise in healing and happiness. We will read essays by Samantha Irby, Rafael Agustin, Jia Tolentino, Roxanne Gay, David Sedaris, Amy Roach, Trevor Noah, Hua Hsu, Terry Galloway, among others. We will also view performances by Nathan Fielder, Sabrina Wu, Beth Stelling, Asha Ward, Zainab Johnson, among others. For stand-up comedians of any level enrolled in this class, you will have the option of writing and performing a standup set.

Admission by application only. For information on specific application requirements and instructions, please see the full course listing on the English Department website. DEADLINE: for all Fall 2025 workshops, applications will open by March 24 and are due via Submittable by 11:59pm on Sunday, April 6. Students will be notified of admissions decisions by 5:00pm ET on Thursday, April 10, and must accept/claim their seats within 24 hours. Workshops will meet the first week of classes.

FAS Divisional Distribution: Arts and Humanities

Creative Nonfiction: Departure and Return: "Home" as Doorway to Difference and Identity

R 0300 PM - 0545 PM

*Instructor Permission Required**Melissa Cundieff*

In this workshop-based class, students will be asked to investigate something that directly or indirectly connects everyone: what it means to leave a place, or one's home, or one's land, and to return to it, willingly or unwillingly. This idea is inherently open-ended because physical spaces are, of course, not our only means of departure and/or return-- but also our politics, our genders, our relationships with power, and our very bodies. Revolution, too, surrounds us, on both larger and private scales, as does looking back on what once was, what caused that initial departure. Students will approach "home" as both a literal place and a figurative mindscape. We will read essays by Kate Greene, Andrea Long Chu, Ciara Alfaro, Xujun Eberlein, Robert Anthony Siegel, David Truer, Angelique Stevens, among others.

Admission by application only. For information on specific application requirements and instructions, please see the full course listing on the English Department website. DEADLINE: for all Fall 2025 workshops, applications will open by March 24 and are due via Submittable by 11:59pm on Sunday, April 6. Students will be notified of admissions decisions by 5:00pm ET on Thursday, April 10, and must accept/claim their seats within 24 hours. Workshops will meet the first week of classes.

FAS Divisional Distribution: Arts and Humanities

Past Selves and Future Ghosts*No meeting time listed**Instructor Permission Required**Melissa Cundieff*

As memoirist and author Melissa Febos puts it: "The narrator is never you, and the sooner we can start thinking of ourselves on the page that way, the better for our work. That character on the page is just this shaving off of the person that was within a very particular context, intermingled with bits of perspective from all the time since — it's a very specific little cocktail of pieces of the self and memory and art ... it's a very weird thing. And then it's frozen in the pages." With each essay and work of nonfiction we produce in this workshop-based class, the character we portray, the narrator we locate, is never stagnant, instead we are developing a persona, wrought from the experience of our vast selves and our vast experiences. To that end, in this course, you will use the tools and stylistic elements of creative nonfiction, namely fragmentation, narrative, scene, point of view, speculation, and research to remix and retell all aspects of your experience and selfhood in a multiplicity of ways. I will ask that you focus on a particular time period or connected events, and through the course of the semester, you will reimagine and reify these events using different modes and techniques as modeled in the published and various works we read. We will also read, in their entirety, Melissa Febos's *Body Work: The Radical Work of Personal Narrative*, as well as Hanif Abdurraqib's *They Can't Kill Us Until They Kill Us*, which will aid our discussions and help us to better understand the difference between persona(s) and the many versions of self that inhabit us.

FAS Divisional Distribution: Arts and Humanities

Creative Nonfiction Workshop: Using Music*No meeting time listed**Instructor Permission Required**Melissa Cundieff*

In this workshop-based class, students will think deeply about how music is often at the center of their experiences, may it be as a song, an album, an artist, their own relationship with an instrument, etc. This class will entail writing true stories about one's life in which the personal and music orbit and/or entangle each other. This will include some journalism and criticism, but above all it will ask you to describe how and why music matters to your lived life. We will read work by Hayao Miyazaki, Jia Tolentino, Kaveh Akbar, Oliver Sacks, Susan Sontag, Adrian Matejka, among many others, (as well as invite and talk with guest speaker(s)). This class is open to all levels.

FAS Divisional Distribution: Arts and Humanities

The Writer Directs: A Script to Screen Workshop

W 1200 PM - 0245 PM

*Instructor Permission Required**Musa Syeed*

Writing is directing and directing is writing. The best screenwriters don't just write snappy dialogue or craft character arcs; they "speak" the primal, visual language of cinema. Working from pre-existing plays/screenplays, as well as from our own original written material, we will explore how to bring a scene on the page to life. Using script analysis and pre-visualization techniques, each student will produce several video exercises to experiment with how words on the page can be effectively translated to the screen.

Admission by application only. For information on specific application requirements and instructions, please see the full course listing on the English Department website. DEADLINE: for all Fall 2025 workshops, applications will open by March 24 and are due via Submittable by 11:59pm on Sunday, April 6. Students will be notified of admissions decisions by 5:00pm ET on Thursday, April 10, and must accept/claim their seats within 24 hours. Workshops will meet the first week of classes.

Narrative Journalism

R 0300 PM - 0545 PM

*Instructor Permission Required**Darcy Frey*

In this hands-on writing workshop, we will study the art of narrative journalism in many different forms: Profile

writing, investigative reportage, magazine features. How can a work of journalism be fashioned to tell a captivating story? How can the writer of nonfiction narratives employ the scene-by-scene construction usually found in fiction? How can facts become the building blocks of literature? Students will work on several short assignments to practice the nuts-and-bolts of reporting, then write a longer magazine feature to be workshopped in class and revised at the end of the term. We will take instruction and inspiration from the published work of literary journalists such as Joan Didion, John McPhee, Adrian Nicole LeBlanc, and John Jeremiah Sullivan. This is a workshop-style class intended for undergraduate and graduate students at all levels of experience. No previous experience in English Department courses is required.

Admission by application only. For information on specific application requirements and instructions, please see the full course listing on the English Department website. DEADLINE: for all Fall 2025 workshops, applications will open by March 24 and are due via Submittable by 11:59pm on Sunday, April 6. Students will be notified of admissions decisions by 5:00pm ET on Thursday, April 10, and must accept/claim their seats within 24 hours. Workshops will meet the first week of classes.

William White

Course ID: 226610

2026 Spring (4 Credits)

Instructor Permission Required

In this workshop, we will study the art and craft of writing novels. We'll consider published work in order to get a better sense of the multiple choices writers can make when they shape a book-length narrative. Our objectives will be the following: (1) to prepare you for writing a novel, (2) to deepen your reading of other writers' work, (3) to workshop the opening chapter(s) of your novel, (4) to help you create a working outline for the kind of book you want to write. While some workshop experience would be useful, it is not required. Students who wish to apply for a creative thesis focused on fiction / a novel-length project are strongly encouraged to take this workshop.

Specialized Topics in Playwriting: Object Memory

No meeting time listed

Sam Marks

Course ID: 226556

2026 Spring (4 Credits)

Instructor Permission Required

Being a theater artist often involves moving in several directions in time simultaneously. We think about our past, our lives, our work, our moment, our vision. How do we find inspiration? How do we make work? How do our creations for the stage live in relation to 'the rest of our lives'. Our use of objects and our memory of those objects can help respond to these questions in writing and acting. This class will seek to have students examine object memory in writing. Students will do writing exercises inspired by visual artists and other playwrights such as Samuel Beckett, Marie Irene Fornes, Louise Bourgeois, Felix Gonzalez Torres, and Cyndi Sherman to see how they extrapolates theater making from the object-memory process. Through writing and discussion, we will investigate ways of being a theater maker. The class will help build student's new play development process toolkit, as they move through the stages of inspiration and execution, from memory to idea to text to performance to image to production. We ask how, as artists, our perspective on the world gets translated into the work we create.

Who Do You Think You Are: A Creative Nonfiction Workshop

R 1200 PM - 0245 PM

Saeed Jones

Course ID: 224740

2025 Fall (4 Credits)

Instructor Permission Required

People don't just happen. In this workshop-based class, students will explore the capacity of memoir and cultural criticism to illuminate their understanding of memory, connection, and self-making. This course is as invested in the craft of writing as it is in interrogating how storytelling functions within systems of power. Students will be asked to consider what the work is doing to us, and what we are using our own work to do to others. Classes will alternate between workshop discussions, in-class writing exercises and close readings of nonfiction by Lucille Clifton, Eula Biss, Carmen Maria Machado, Toni Morrison, Vivian Gornick, Hanif Abdurraqib, and Kiese Laymon among others.

This course will be taught by Saeed Jones, MFA. If you are interested in joining the course, please complete this application by August 11, 2025. A maximum of 12 students will be selected to join the course. The application requires a 2-3 page writing sample and a 250 word maximum reflection on why this course appeals to you. We will follow up with everyone who applies for the course by email once decisions are made. This course is also offered through the Harvard Medical School as MMH 709.

Hybrid Beast: Form, Manifesto, and Wild Experiment: Poetry Workshop
with Tina Chang

Course ID: 226804
2026 Spring (4 Credits)

Instructor Permission Required

The tradition of poetry is widening, drawing from many art forms, blending and fusing to create contemporary cross-pollinated forms. In this class we will explore the many ways in which poetry is increasingly a hybrid beast, as innovative projects are envisioned across genres. We will begin with some traditional forms and move toward discussing the process by which poets work with visual art, comics, research and white space. We will practice the ekphrastic poem, long poem, zuihitsu, mosaic poem, erasure, collage, ghazal, pecha kucha, and the many formal experiments that make the current environment of poetry so eclectic and exciting. Class work will be comprised of student writing and critique, linguistic adventure, wild meanderings, in order to understand future possibilities for one's own poems. The final project is a multi-disciplinary chapbook (no previous chapbook experience necessary) and an optional class reading.

ENGLISH CTLL
"Telling and Retelling": Reshaping and Remixing Myths and Fairy Tales

Course ID: 220139
2026 Spring (4 Credits)

No meeting time listed

Instructor Permission Required

William White

This is a fiction workshop for those who are interested in retellings. In this class, we will learn how other writers of the 20th and 21st centuries have taken fairy tales, epic poetry, problematic horror, and Chekov's short fiction, and retooled them for their own purposes. You will also practice the art of retelling in two ways: first, you will write your own flash piece inspired by some fairy tale of your choosing, and second, you will select another "story" (I use this term broadly – you can select just about anything you wish, within limitation, of course) to retell in a full-length short story or novel chapter. This workshop is open to beginning and advanced writers.

ENGLISH CTMA
Poetry As Magic: Poetry Workshop with Tina Chang

Course ID: 226805
2026 Spring (4 Credits)

Instructor Permission Required

Magic: [maj-ik] (noun): power or influence exerted through art; any extraordinary or mystical influence, charm, power. The name of this course pays tribute to a class that poet Jack Gilbert took with Jack Spicer. What summons us to a poem or a poet? Is it lyricism, a singular voice, an undeniable image, incantation, song, material so raw that we cannot turn away? Though one can certainly view poems as well-oiled machines to perfect and hone, we might also view poems as living energy that requires creation, motion, resuscitation, heartbeat. In these poems, we are immediately under the poem's spell as we are asked to walk into their imagined dwellings. So how do we tap into this magic as writers? We will read writers from different schools, cultures and traditions, examining how they define themselves. This class teaches students to analyze and interpret written texts, and to craft clear writing that exerts a quiet, magical influence on the reader. Class work will be comprised of student writing and critique, formal experiments, and creative play. Writing is produced and discussed each week, followed by a revision portfolio and a final chapbook

ENGLISH CTV
Writing for Television: Developing the Pilot: Workshop

Course ID: 203266
2025 Fall (4 Credits)

M 1200 PM - 0245 PM

Instructor Permission Required

Sam Marks

This workshop introduces the television pilot with a focus on prestige drama and serialized comedy. Students will excavate their own voice and explore the structure and execution of pilot writing through a first draft of their own original script. With intensive reading and discussion of student work we will examine elements of TV writing, such as treatments and outlines as well as character, dialogue, tone, plot, and, most importantly, vision. Over the semester, we'll turn ideas into worlds and worlds into scripts.

Admission by application only. For information on specific application requirements and instructions, please see the full course listing on the English Department website. DEADLINE: for all Fall 2025 workshops, applications will open by March 24 and are due via Submittable by 11:59pm on Sunday, April 6. Students will be notified of admissions decisions by 5:00pm ET on Thursday, April 10, and must accept/claim their seats within 24 hours. Workshops will meet the first week of classes.

Literature Today

MW 0130 PM - 0245 PM

Deidre Lynch, Indraneel Mukherjee

Course ID: 132844
2025 Fall (4 Credits)

All literature was contemporary at some point, but the literature that is contemporary now provides special opportunities for enjoying, questioning, and understanding the world. Literature Today focuses on works written since 2000—since most of you were born. It explores how writers from around the world speak to and from their personal and cultural situations, addressing current problems of economic inequality, technological change, structural prejudice, and divisive politics. We will encounter a range of genres, media, and histories to study contemporary literature as a living, evolving system. The course uniquely blends literary study and creative writing—students will analyze literature and make literature. The conviction that these practices are complementary will inform our approach to readings and course assignments.

Literary Forms

TR 1200 PM - 0115 PM

Leah Whittington

Course ID: 216063
2025 Fall (4 Credits)

Instructor Permission Required

This foundational course for English concentrators examines literary form and genre. We explore some of the many kinds of literature as they have changed over time, along with the shapes and forms that writers create, critics describe, and readers learn to recognize. The body of the course looks to the great literary types, or modes, such as epic, tragedy, and lyric, as well as to the workings of literary style in moments of historical change, producing the transformation, recycling, and sometimes the mocking of past forms. While each version of English 20 includes a different array of genres and texts from multiple periods, those texts will always include five major works from across literary history: Beowulf (epic), The Winter's Tale (tragicomedy or romance), Persuasion (comic novel), The Souls of Black Folk (essays; expository prose), and Elizabeth Bishop's poems (lyric). The course integrates creative writing with critical attention: assignments will take creative as well as expository and analytical forms.

Course Note: English 20 is one of the required Common Courses for English concentrators and Secondaries and is a limited enrollment course which will prioritize sophomores and first-years; juniors and seniors who want to take it as an elective will be considered for any remaining spots. Enrollment priority exceptions may be made for people changing concentrations or presenting other notable reasons.

Shakespeare After Hamlet

2025 Fall (4 Credits)

M 1245 PM - 0245 PM

Instructor Permission Required

Gordon Teskey

How did Shakespeare's art develop in the years following Hamlet (1600-1601), which ends with a roar of cannons, warning of great tragedies to come? The second half of Shakespeare's career (1601-1611) includes such magnificent plays as Othello, King Lear, Macbeth, Antony and Cleopatra, Coriolanus, and The Tempest. His style becomes more gnarly and tough, more expressive and free. His view of human character becomes harsher, yet his vision of love grows deeper. The course ends with The Tempest, Shakespeare's magical farewell to the stage. Shakespeare's art will be explored through performance of scenes. There are fascinating film versions of these and other late plays, including a version of Hamlet set in New York City, where the "To be or not to be" speech is left on a telephone answering machine. In this course we examine how for us today, as in Shakespeare's own time, what we think of as Shakespeare's plays is the result of interaction between what was written on the page and what was performed on the stage—or, in our case, in film versions. Final projects for this seminar will involve taking an individual play and comparing the text with two film versions.

Elizabeth Bishop and Others

R 0300 PM - 0545 PM

Vidyan Ravinthiran

Course ID: 216197

2025 Fall (4 Credits)

Instructor Permission Required

This course introduces students to the poetry, literary prose, and artful correspondence of one of the major poets of the twentieth century, considering her innovations in all these genres. We will look at her writing alongside the mid-century shift from "closed" to "open" verse forms, and relate stylistic issues to the intellectual and social changes, and political and historical developments of the period. Bishop's critique of received ideas about nationality, race, power, gender, sexual orientation, and the overlap between culture and nature, connects with her cosmopolitanism: she has links to Canada, the U.S, and Brazil. "Others" refers to how her writing considers the sociopolitical reality of other people, and also to the comparisons we'll draw between her writing and that of other poets.

Indigenous Sci Fi, Horror, Fantasy, and Futurisms

No meeting time listed

Christopher Pexa

Course ID: 222815

2026 Spring (4 Credits)

Instructor Permission Required

This course will examine contemporary writings by Native American and Indigenous authors across the genres of sci fi, horror, and fantasy, with the aim of thinking about Native American and Indigenous futures (and futurisms) more broadly, and also in ways that may exceed genre altogether. In other words, our investigation will be organized according to conventional sci fi genres of slipstream, alien contact, and apocalypse, but also to non-genre expressions of Indigenous futurity. By juxtaposing literary works from authors writing both within the boundaries of the United States and beyond, we will be able to make connections between them that highlight both their common sovereignty struggles and shared utopian visions, but also keeps in view the many meaningful differences in how Native American and Indigenous aesthetic productions perform the work of future-making.

Harvard and Native Lands

No meeting time listed

Alan Niles

Course ID: 220241
2026 Spring (4 Credits)

Instructor Permission Required

Harvard's beginnings included a promise to educate both "English and Indian youth." From its inception, however, Harvard's endowment included Native lands expropriated through war, theft, and coercion. Drawing inspiration from Harvard's own Legacy of Slavery initiative and the Land-Grab Universities website, this class will conduct original research on Harvard's long history of involvement with Native communities and Native lands. We will work hands-on with archives at Harvard and other area institutions, developing research skills in navigating collections, reading early handwriting, and interpreting colonial documents. Readings and class activities will engage New England colonialism, the long history of Indigenous dispossession and resistance, and the political struggles of Indigenous communities today. We will closely examine texts including poems, speeches, oral narratives, maps, short stories, and deeds, exploring the centrality of land and environment in colonial and Indigenous histories and literatures. In the second half of our class, we will work collaboratively to design and execute group or individual research projects. Previous iterations of this course in Fall 2022 and Fall 2023 gathered data on Harvard's land transactions and resulted in a set of student-driven research projects on sites, properties, and individuals connected to Harvard's Indigenous pasts; our research will build on that work.

Consciousness in Fiction from Austen to Woolf

M 0300 PM - 0545 PM

James Wood

Course ID: 118850
2025 Fall (4 Credits)

Instructor Permission Required

In this seminar, we look at the ways in which a range of writers represent the mind on the page: the mind at thought, in agitation, at rest, at prayer, in distress, in rebellion, and just doing nothing (or apparently nothing). This examination allows us to scrutinize just over a hundred years of novelistic development and experiment – from 1813 to 1927, from Jane Austen to Virginia Woolf – a period that might rightly be considered the high-point of the novel's rise. We will discover that as the novelistic treatment of consciousness changes, so the idea of what a mind (or a self) is, also changes: the form (the means of representation) modifies the content (what is represented). What might seem at first like a fairly small thing – a question of novelistic technique – will turn out to have massive and far-reaching consequences for our sense of self. Writers studied: Austen, Flaubert, Dostoevsky, Tolstoy, Chekhov, Fontane, Woolf.

Before the Novel: Medieval Romance

No meeting time listed

Nicholas Watson

Course ID: 226410
2026 Spring (4 Credits)

Instructor Permission Required

This course would read a wide selection of romances, one of the great narrative forms of the middle ages. We'd look at specific romance elements, including the quest; at the structure of romances or what Jameson calls their "ecology," the experimental spaces they open and eventually close; at the gendering of persons within romances; and other topics. Texts TBD but would include one or two Marie de France Lais (short romances); at least one Arthur story, potentially Malory's *Morte d'Arthure* (selections); King Horn and Haveloc the Dane; Sir Gawain and the Green Knight; and others. Some in translation, some in Middle English.

Superheroes: Stories, Characters, Comics, Art and Society

2026 Spring (4 Credits)

*No meeting time listed**Instructor Permission Required*

Stephanie Burt

What's a superhero and why do people care? Where do they come from, what do they do, and why would anyone ever choose to be one? We will follow those questions through DC and Marvel continuity, with attention to super-famous figures, national myths, and groups of young people and outcasts: Superman, Supergirl, the X-Men, Captain America (and Bucky), Wakanda. We will think about sexuality, and (respectfully!) about the military. We will look at comics as an art form and as a visual medium. We will consider these larger-than-life figures in older narrative works (probably by John Milton), in fiction, in new poems, and in games. And-- with the help of a tabletop role-playing game-- we may create heroes and heroic plots of our own.

Sophomore Tutorial: Literary Methods

2025 Fall (4 Credits)

MW 1200 PM - 0115 PM

*Instructor Permission Required**Alan Niles*

This course, taught in small groups and required for concentrators, introduces theories, interpretive frameworks, and central questions about literature and literary media. What do we do when we read? What is an author? What do we mean by "literature" itself? How might we compare and evaluate interpretations? How do the historical, social, cultural, and legal frameworks around a text shape its meanings and its effects? Combining major critical and theoretical writings with primary works, the course investigates how literary production and interpretation are informed by philosophical and aesthetic traditions, gender and sexuality, race and ethnicity, national and post-colonial identities, and the material forms in which literature circulates, from parchment books to the internet. Students will also practice fundamental literary research methods through close engagement with Harvard libraries.

ENGLISH 111
Epic: From Homer to Star Wars

Course ID: 130257
2026 Spring (4 Credits)

No meeting time listed
Leah Whittington

Epic is one of the most enduring and far-reaching forms of artistic expression. From the heroic poems of the ancient Near East to modern films of quest and adventure, epic speaks to the shared values and collective aspirations of cultures, peoples, and communities. But if its formal conventions and thematic interests endure, epic changes over time. In this course, you will study the historical and literary evolution of epic as it moves from oral verse into new genres and media, reading texts from the ancient Mediterranean alongside works of poetry, fiction, and cinema from early modern Britain, twentieth-century America, and the contemporary Global South. We will look at some texts in their entirety and others in extracts, focusing on Homer's *Iliad* and *Odyssey*, Vergil's *Aeneid*, Milton's *Paradise Lost*, Derek Walcott's *Omeros*, The Mahabharata (in prose and film versions), and George Lucas' *Star Wars*, with detailed analysis of Gwendolyn Brooks's American epics on Black life, Annie Allen and *In the Mecca*. If issues of identity, belonging, and community have always been explored in epic, what is the place of epic in a pluralist multi-culture? What are our contemporary epics today?

FAS Divisional Distribution: Arts and Humanities

ENGLISH 115B
Chaucer: The Canterbury Tales

Course ID: 146214
2025 Fall (4 Credits)

MW 1200 PM - 0115 PM
Anna Wilson

What makes stories so pleasurable and revealing but also so enraging and dangerous? How are we to think about the strong emotions they evoke and learn to resist as well as appreciate their power? This course revisits Geoffrey Chaucer's classic fourteenth-century poem, *The Canterbury Tales*: the deepest and most caustically

entertaining analysis of storytelling ever written. The *Canterbury Tales* consists of a series of tales told by members of a pilgrimage on their way from London to Canterbury, representatives of the internally divided social world of Chaucer's England. Some are serious, others funny, obscene, or offensive; some are religious, others not at all; some deal with issues local to England, others range across the Europe and the rest of the known world; many are told against other pilgrims. Written in a long-ago past, the poem jumps off the page, in turns unrecognisably weird and startlingly modern. We read the poem in the language in which it was written, Middle English, easy and fun to learn with early help: no previous experience with the language, or with the medieval era, is necessary. We will also explore the poem's long-ranging impact on English literature, including several contemporary reimaginings. Classes include a short lecture on a tale, and class discussion, which continues in weekly sections. Course projects include an essay, a collaborative report on one tale, and a creative option. Students of all years and from all concentrations and programs are welcome. If you are a graduate student interested in taking this class, please contact Prof. Wilson to indicate interest before term begins; there may be an additional graduate section if there is sufficient demand.

This course satisfies the "Pre-1700 Guided Elective" requirement for English concentrators and Secondary Field students.

ENGLISH 148

Modern Monsters in Literature and Film

MW 1030 AM - 1145 AM

Deidre Lynch

Why study monsters? Though modern peoples don't fear monsters and indeed don't even believe in them (or so we tell ourselves), monsters have nonetheless done an awfully good job of colonizing twenty-first-century popular culture. At present marauding vampires and the walking dead are everywhere (and then, too, there are the internet trolls). Our world seems to dedicate a lot of energy to exactly the fears we thought we were supposed either to have exorcised by becoming modern and disenchanted or to have exorcised simply by growing up and no longer needing to look under our beds before falling asleep at night. Why does the monstrous compel us? To help explain the fascination with the monster, this course looks backward, to nineteenth-century Gothic fiction and to the horror cinema that took up its mantle. The course's premise is that by taking seriously monsters' staying power we can learn a lot--about, for instance, the way the horror tradition has helped modernity make sense of itself. Monster stories are stories about the failures built into our systems of categorization and notions of normality. They make vivid the potential for violence in the notions of cultural purity and cultural inheritance that modernity uses to organize its accounts of identity and community. We'll begin in the year 1818 with Mary Shelley's *Frankenstein*. Our next move will be to the fictions that were written in the shadow of that famous ghost-story competition that on a dark and stormy night ushered into being both Shelley's monster and (via the poet Lord Byron and his traveling companion John Polidori) the first modern vampire. Pursuit of this project will have us reading novels, novellas, and short stories by Sheridan Le Fanu, Bram Stoker, Mary Elizabeth Braddon, Robert Louis Stevenson, Gaston Leroux, H.G. Wells, and others. We'll turn briefly near the end of the semester to the early horror films that gave the Gothic tradition's recurring preoccupations with the animation of the dead a new lease on life. Bringing the story of the class up to the present, we'll conclude the semester with some episodes of Ben Stiller's Apple TV show *Severance*.

Keats Isn't Dead: How We Live Romanticism

No meeting time listed

Vidyan Ravinthiran

Our thoughts and feelings about identity, self-expression, and the power of the imagination draw on the British Romantic poetry of the Long Eighteenth Century—whether we've read any or not. Focusing on John Keats (his key poems, and his key ideas, about "negative capability", the "camelion poet", and so on), this course makes unconventional connections into the twentieth, and twenty-first century. Tracking issues of race, class, gender and sexuality, we'll bounce from Keats into war verse; African-American poetries; world/postcolonial writing; the literature of social class; feminist experimentalism; and constructions of masculinity. Concentrators will learn how to analyze poetry in both closed and open forms.

One of the great creators in his, or any, era. W. B. Yeats (1865-1939) left us a matchless body of lyric and dramatic verse, including love poems, political meditations, ballads, prophetic warnings, palinodes, and rewritten myths. He also wrote and co-wrote transcribed folktales, novels, literary criticism, memoir, political speeches, records of mystical visions, and tens of thousands of letters; promoted Irish culture; ran a theatre company; won a Nobel prize; stood against empire and theocracy (but in favor of aristocracy); and changed his mind when he knew he was wrong. We will read all his major poems and other works, with attention to their composition, along with some rivals, friends and contemporaries in Ireland and beyond; we will also look at critical traditions around him.

This course satisfies the "1900-2000 Guided Elective" requirement for English concentrators and Secondary Field students.

*No meeting time listed**Tracy K. Smith*

African American poets have long embraced the private freedoms of the lyric poem—freedom to claim the authority of an uncontested first person "I"; freedom to wrangle language into new and startling forms; freedom to depart as needed from the strictures of linear reality. And yet, from its earliest iterations, African American poetry has also concerned itself with correcting and complicating the official narrative of Black life and Black subjectivity in America. This course will explore the means by which Black poets have innovated upon the lyric tradition to accommodate a sense of allegiance to a collective. In this tradition, the lyric poem has become a powerful tool with which to ponder the dynamics of self and other, intimate and political—and justice and injustice. Course readings will include work by seminal 20th Century American figures such as Langston Hughes, Gwendolyn Brooks, Robert Hayden and Lucille Clifton, as well as contemporary voices like Jericho Brown, Tyehimba Jess, Morgan Parker, Eve L. Ewing and others. We will also devote attention to lyric corollaries in film, music, visual art and performance. Students will be encouraged to respond to course themes and texts in both critical and creative form.

W 0945 AM - 1145 AM

*Instructor Permission Required**Nicholas Watson*

Julian of Norwich (born 1343) and Margery Kempe of Lynn (born 1373) are the two earliest women writers in English whose names we know. They lived thirty years and thirty miles apart, met only once over a period of some days, and wrote long, completely different books, both inspired by what they understood as visionary encounters with the divine. Julian was a Christian intellectual, a brilliant writer, intensely visual but also abstract, who spent a lifetime writing and rewriting an intricate and optimistic analysis of how to live as an aspiring and suffering human being in the world that many people around the world still live by. Margery (she did not much like her husband's name) was a religious experimentalist, devout globe-trotter and performance artist, equally brilliant, whose energies seemed to have gone into living more than writing, but who in old age dictated then revised what many understand as the first English autobiography. After being mostly ignored for several hundred years, they are now being read with care, although by different readerships and in different ways. It is time they were brought together again. In this discussion-based course, we read Julian of Norwich's *Revelation of Love* and *The Book of Margery Kempe* alongside one another, as well as in the light of other women writers who drew inspiration from visions, revelations, or dreams, from the early Christian martyr Perpetua of Carthage in the third century CE to the reclusive New England poet Emily Dickinson in the nineteenth. We pay particular attention to Julian and Margery's direct precursors, Angela of Foligno, Gertrude the Great, and Marguerite Porete, among others. We consider how it was that revelations were able to make an innovative, demanding and prestigious mode of thought and writing possible for women who were excluded by their gender from the formal education available to male contemporaries. We think about what revelations are, how they function as an embodied, kinetic, and dialogic mode of consciousness, and the stylistic and intellectual experimentation this mode of consciousness enables. We speculate on potential connections between the visionary and other non-natural ways of seeing the world. Finally, we consider the excruciating difficulty of being and writing as a

visionary and the cultural and psychic pressures the role of visionary involved and involves. Although the main setting of the course is the world of Julian and Margery, we do not forget that we are reading them in the now.

Course Note: This course is a limited-enrollment seminar open to both undergraduate and graduate students, including PhD students in English (please contact me for enrolment details). Students in Harvard Masters' programs welcome.

City Fictions

TR 0900 AM - 1015 AM

Tara Menon

Cities are made of contradictions: playgrounds for the rich and sites of concentrated poverty, highly organized and totally chaotic, an endless party and the loneliest places on earth. How do we write about them? In this course, we will visit four major metropolises around the world: London, Bombay, New York, and Seoul. We will focus primarily on one narrative work set in each of these cities—Charles Dickens's *Bleak House*, Suketu Mehta's *Maximum City*, Teju Cole's *Open City*, and Hwang Sok Young's *At Dusk*—and supplement our reading with short stories, journalism, sociology, movies, and television by writers and directors including: Zadie Smith, Micaela Coel, Edith Wharton, James Baldwin, Katherine Boo, Spike Lee and Bong Joon-Ho.

FAS Divisional Distribution: Arts and Humanities

ENGLISH 185E

The Essay: History and Practice

No meeting time listed

James Wood

Matthew Arnold famously said that poetry is, at bottom, "a criticism of life." But if any literary form is truly a criticism of life, it is the essay. And yet despite the fact that all students write essays, most students rarely study them; bookshops and libraries categorize such work only negatively, by what it is not: "non-fiction." At the same time, the essay is at present one of the most productive and fertile of literary forms. It is practiced as memoir, reportage, diary, criticism, and sometimes all four at once. Novels are becoming more essayistic, while essays are borrowing conventions and prestige from fiction. This class will disinter the essay from its comparative academic neglect, and examine the vibrant contemporary borderland between the reported and the invented. We will study the history of the essay, from Montaigne to the present day. Rather than study that history purely chronologically, each class will group several essays from different decades and centuries around common themes: death, detail, sentiment, race, gender, photography, the city, witness, and so on. In addition to writing about essays – writing critical essays about essays – students will also be encouraged to write their own creative essays: we will study the history of the form, and practice the form itself. Essayists likely to be studied: Plutarch, Montaigne, Hazlitt, De Quincey, Woolf, Benjamin, Orwell, Camus, Primo Levi, Barthes, Baldwin, Sontag, Dyer, Didion, Leslie Jamison, Knausgaard, Ta-Nehisi Coates.

This course satisfies the "1900-2000 Guided Elective" requirement for English concentrators and Secondary Field students.

Video Game Storytelling

TR 1200 PM - 0115 PM

Vidyan Ravinthiran

Although this course does discuss blockbuster games, it's primarily concerned with indie titles prioritizing discovery over system mastery—asking us to think differently. Drawing on video game scholars—Melissa Kagen, Brendan Keogh, Ian Bogost—we'll examine the gendered deconstruction of horror-codes in *Gone Home* (described by Brigid Kennedy as "an explicitly queer videogame with an explicitly queer narrative"); the interplay between the singular and the shareable in the trans micro-narrative, *Dys4ia*; and consider how *Return of the Obra Dinn* uses retrospective plotting to query a purely economic view of the world. We'll also discuss *Firewatch*, *The Stanley Parable*, *Stray* and *Stardew Valley* among other games, and consider how this art form, better than any other, probes the division identified by Theodor Adorno within capitalist society, separating "work" from

Course ID: 218143

Adaptation: The Art of Retelling

No meeting time listed

Anna Wilson

What makes a good adaptation? Why retell an old story? This class explores texts that are in conversation with others: adaptation, translation, fanfiction, parody, pastiche, and the remix. We will think about the role of form, genre, and media in adaptation, the decisions involved in transposing a story from novel to screen or stage, from oral storytelling to the printed page to digital archive, across times, contexts, languages, and audiences. Texts/movies discussed include fairytales, *The Great Gatsby*, *Ma Rainey's Black Bottom*, and *Arrival*. We will also consider the legal frameworks, technologies, cultural institutions, and audience expectations that constrain adaptation: what is the nature of authorship? How much can a person own a text, or a character? How far can an adaptation go before audiences no longer recognize, or reject, an adaptation? What economic and cultural roles do adaptations play in our contemporary media landscape? The final assignment will include the option to create your own adaptation using some of the critical models we have explored. This is a lecture and discussion class accessible to non-concentrators.

Beowulf and Seamus Heaney

No meeting time listed

Instructor Permission Required

Daniel Donoghue

This course balances translation, poetics, and literary criticism. The commercial success of Seamus Heaney's translation of *Beowulf* has given it a prominence in the general reading public the poem has rarely if ever enjoyed. At the same time its popularization at the hands of a self-described "interloper" has created a certain amount of anxiety among scholars of Old English. Our weekly discussions will include issues of translation while we compare our in-class efforts with Heaney's and with other versions that have been published over the years. We will also consider Heaney's translation on its own merits as a poem and in relation to the body of poetry he produced over his lifetime. All of this comparative work will take place against the backdrop of our week-by-week translation of *Beowulf*.

Space permitting, this course is open to qualified undergraduates. Undergraduates, please contact Prof. Donoghue before classes begin if you would like to take the course.

Stages of Life, in Literature

W 0945 AM - 1145 AM

Instructor Permission Required

Stephen Greenblatt, Joseph Koerner

People change. They grow up and grow old, each differently but in ways divisible into stages. Different cultures and different eras understand and number these stages differently, but between birth and death bodies and minds develop and age. This interdisciplinary seminar, conducted together with a course in the History of Art and Architecture department taught by Professor Joseph Koerner, explores how art and literature, with their distinctive capabilities and limits, give visual and verbal shape to "life history" from infancy to "second childishness and mere oblivion, sans teeth, sans eyes, sans taste, sans everything" (Shakespeare). Focused on the European Renaissance with consideration of later (particularly Romantic) developments. Enrollment Limited.

Divine Comedies: Graduate Seminar

Nicholas Watson

A study of a series of visionary works from the thirteenth and fourteenth centuries, including Guillaume de Lorris' s Romance of the Rose, Dante Alighieri's Divine Comedy, John of Morigny's Book of Flowers, Geoffrey Chaucer's House of Fame, William Langland's Piers Plowman, and Christine de Pisan's Book of the City of Ladies. We read these works through a late-medieval Aristotelian understanding of the imagination as a fundamental but fallible instrument of human perception, observing how they respond to traditions of writing about dreams, visions, and journeys to heaven or hell that go back to classical and Christian antiquity, in which human cognition and the shape of the cosmos are thought about very differently. We consider the inter-relationship between the poetic and the visionary in light of the categories of orthodoxy and discretion of spirits, at a period when both were fiercely contested. We also consider visionary writing and the contradictory claims it makes for the truth of intense imaginative experience as a precursor of the ubiquitous but puzzling modern concept of fiction, with special early reference to W. G. Sebald's 2001 novel Austerlitz. Texts not written in English will be read mainly in translation; no previous knowledge of Middle English, or of medieval visionary writing, is required.

Course Note: Space permitting, this course is open to qualified undergraduates. Undergraduates, please contact Prof. Watson before classes begin if you would like to take the course. Students in Harvard Masters' programs welcome.

Metaphysical Poetry: The Seventeenth-Century Lyric and Beyond

2025 Fall (4 Credits)

M 0345 PM - 0545 PM

Instructor Permission Required

Gordon Teskey

In an age of scientific and political revolution, how do poets respond when common beliefs about God, humans, cosmic and social order, consciousness, and gender have been taken away? Modern poetry starts in the seventeenth century when poets, notably women poets, seek new grounds for poetic expression. Poets to be read include the familiar ones - Donne, Herbert, Marvell, Vaughan, and Traherne - plus Jonson, Lanier, Philips, and Cavendish, ending with Milton's "Lycidas." The art of criticism will be a central theme.

Space permitting, this course is open to qualified undergraduates. Undergraduates, please contact Prof. Teskey before classes begin if you would like to take the course.

Uncommon Tongue: Lucille Clifton and her Literary Kin

2026 Spring (4 Credits)

No meeting time listed

Instructor Permission Required

Tracy K. Smith

Across her body of work, great American poet Lucille Clifton celebrates, defends and bears witness to the complexities and the revelations of Black life. Committed to the trends and crises of her own time period, Clifton also draws consistently and inventively upon various strands of history and myth; the result is a body of work alive with ever-urgent relevance to the 21st Century's crises of white supremacy, political disenfranchisement and planetary disaster. In this seminar, we will explore the ways a large-scale and oftentimes cosmic vision of existence is housed within Clifton's range of concerns and her use of familiar vernaculars. Through readings of poetry and prose from across her career, and the work of her peers and literary forbears, we'll gauge Clifton's aesthetic and moral commitments, which combine to form a legible and compelling philosophy of life, death, affliction, indebtedness and forgiveness.

Space permitting, this course is open to qualified undergraduates. Undergraduates, please contact Prof. Smith before classes begin if you would like to take the course.

Poetry and Poetics (Lyric and Its Discontents)

2025 Fall (4 Credits)

T 1245 PM - 0245 PM

Instructor Permission Required

Stephanie Burt

What is poetry? What is lyric? Who cares, and why? How have the answers to those questions changed since people began writing verse in English? We will focus-- though not exclusively!-- on modern and contemporary answers to those questions as we read, together, poets, critics and thinkers who have posed them, from Samuel Johnson to Langston Hughes to Allen Grossman, Timothy Yu or Anna Jackson, and major poems that propose or imply their own answers. Students are encouraged to bring to the seminar the poets and poems that they themselves want to study, not only canonical gems (Hughes, Moore, Tennyson) but major figures from outside the U.S. and U.K.

Space permitting, this course is open to qualified undergraduates. Undergraduates, please contact Prof. Burt before classes begin if you would like to take the course.

Book Theory

2026 Spring (4 Credits)

No meeting time listed

Instructor Permission Required

Deidre Lynch

In this seminar we will work our way through theoretical work presenting the Western book as, variously, medium, interface, commodity, technology (including technology of empire), storage device, and "scriptive thing" --both classic theories (e.g., Jacques Derrida, Walter Benjamin, Ernst Curtius, Gérard Genette, Roger Chartier) and more recent ones (e.g., Mark McGurl, Jessica Pressman, Leah Price, Nicholas Thorburn, Kelly Wisecup, Robin Bernstein, Tia Blassingame). We'll also consider such topics as print, publics, memory, ephemera, waste, and the often-announced death of the book. And as aids to our collective theorizing, we'll derive resources from artists' books (e.g. those created by Stéphane Mallarmé, Angela Lorenz, and Tia Blassingame) and from fiction that calls attention to its own physical platform (e.g. Laurence Sterne's *Tristram Shandy*, Ling Ma's *Severance*, and Heike Geissler's *Seasonal Associate*).

Wild Criticism

2026 Spring (4 Credits)

No meeting time listed

Instructor Permission Required

Vidyan Ravinthiran

Beginning with Oscar Wilde, who suggested in 1891 that "the primary aim of the critic is to see the object as in itself it really is not," this course shows today's debates over "creative criticism" and "postcriticism" to have a long history. We'll consider, in particular, writers who quote other writers at length—close reading them—but in nonplussing, counterintuitive, even shocking ways. Monica Youn and William Empson, for instance, read John Milton against the grain; Pierre Bayard returns to Agatha Christie's *Who Killed Roger Ackroyd?* and suggests another solution to its murder mystery; Adam Phillips reimagines Melville's *Bartleby, the Scrivener* as a tale about an eating disorder. W.E.B. Du Bois, Jorge Luis Borges, Vladimir Nabokov and Anne Carson all write major works that are also experiments with the rhetorics of literary criticism. Which all raises the question: how should we write about books now? Students taking this course will author "wild criticism" of their own, moving across and into and through and between texts in adventurous ways.

Space permitting, this course is open to qualified undergraduates. Undergraduates, please contact Prof. Ravinthiran before classes begin if you would like to take the course.

Placement Seminar

Course ID: 207884
2025 Fall (4 Credits)

W 0400 PM - 0500 PM

Instructor Permission Required

Beth Blum, Louis Menand

The job placement seminar will meet during the Fall semester to help students prepare dossiers of their work for the academic job market and facilitate explorations of careers beyond the academy. The class will meet roughly every two weeks, providing a supportive structure for participants to produce, workshop, and revise application materials. We will also arrange mock interviews and practice teaching demonstrations. The placement officers provide one-on-one support with editing/proofing materials and guidance in navigating the applications process. This seminar is restricted to students in the English department. We welcome students who are intending to actively apply for postdocs or jobs this year to enroll; some seminar sessions suitable for those interested in thinking about the market or their career options but not actively applying this year will be advertised more widely and open to all graduate students in the department.

Environmental Science and Public Policy

Environmental Sci & Public Pol

ESPP 77
Technology, Environment, and Society
MW 1030 AM - 1145 AM
Sheila Jasanoff

Course ID: 109882
2025 Fall (4 Credits)

Our interactions with the natural world are increasingly mediated through changes in technology. Technologies create risks, generate solutions, reshape the environment, and alter our perception of the boundaries between nature and artifice. This course draws on major theories of technology and society to inform and deepen our understanding of environmental crises, problems, possible fixes, and policy options.

This class requires students to enroll in an untimed, placeholder section/lab during registration and to submit time preferences. Sections will be assigned by April 26.

ESPP 90B
The EV Revolution: Outlook, Environmental Impact, Policy, and Challenges
M 0300 PM - 0530 PM
Elaine Buckberg

Course ID: 223090
2026 Spring (4 Credits)

Instructor Permission Required

Auto is undergoing a technological revolution with the shift to electric vehicles (EVs) and the development of autonomous vehicles. Decarbonizing private transportation is essential to achieving climate goals, with transportation overall representing 28% of U.S. greenhouse gas emissions. EV sales are now growing rapidly: in 2022, battery electric vehicles (EVs) represented about 22% of new vehicle sales in China, 15% in the EU and 5% in the U.S. Forecasts suggest EVs will represent close to 50% of new vehicle sales in the U.S. by 2030 and higher in China and Europe. The EV transition has far-reaching repercussions from emissions to macroeconomic impacts to national security and poses substantial challenges in the rapid development of new supply chains. In this seminar, we will study the intersection of EVs, the energy transition, environmental science, policy, and economics. The current pace of change is dramatic but has roots going back 50 years to early U.S. environmental regulation and efforts to reduce dependency on Middle East oil; auto has been a critical element in trade policy back to the 1994 North American Free Trade Agreement (NAFTA). Policy is pivotal today, in the U.S. and overseas, in terms of determining the pace of EV adoption, how supply chains develop, and how fast they evolve. The Inflation Reduction Act of 2022 (IRA) enables faster EV adoption through tax credits for EV production and purchases. Technological progress, especially in battery technology, will be critical in the path forward. We will analyze a range of EV issues including those highlighted above as well as charging, health impacts, equity, and international market differences.

ESPP 90G
The Law and Policy of Climate Change: Influencing Decision Makers

Course ID: 208113
2025 Fall (4 Credits)

Aladdine Joroff

Empirical data demonstrate that the climate is changing and that these changes could produce increasingly serious consequences over the course of this century. Governments and private actors around the world are strategizing, debating, lobbying, implementing, and defending mechanisms to both mitigate and adapt to the impacts of climate change. This course will explore (i) the legal framework in which climate change action occurs in the United States, (ii) policy tools available to regulators, (iii) impacts on regulated entities and individuals and (iv) opportunities for private stakeholders to participate in and influence climate change decisions.

Climate, Crops, and Food Security

2025 Fall (4 Credits)

R 0900 AM - 1130 AM

Instructor Permission Required

Peter Huybers

The number of people suffering from hunger began to increase in 2015, after decades of steady decline, and began to rise more sharply since the beginning of the COVID pandemic. The drivers of these trends in food security and malnutrition that are highlighted by international aid agencies are conflict, economic shocks, and climate extremes. In this course we will inquire, specifically, into linkages among climate change, extreme weather events, agricultural production, and food insecurity, and also consider the broader context of how conflict, socioeconomic, and health conditions may be susceptible to extreme weather and influence the ability to mitigate and adapt to changes in extreme weather. The answer to this inquiry is important: inasmuch as climate change is a fundamental driver of recent decreases in food security, the almost inevitable continued changes in climate in the coming decades are of major concern for food security going forward. Moreover, identification of the specific pathways by which climate change influences food security is critical for devising appropriate mitigation and adaptation measures. We will cover how variations in temperature, water, and sunlight influence crop yield; how exposure to these environmental variations alters under climate change; connections between food production shocks and food insecurity; and the degree to which changes in food security can be predicted. Individual classes will be organized around academic papers encompassing distinct viewpoints, and through reading, discussion, and hearing from outside speakers. We will, as a class, seek some overall understanding of the drivers of food insecurity and how these can, at least in principle, be addressed.

ESPP 90P

Course ID: 220481

Climate Responsibility and Climate Action

2026 Spring (4 Credits)

No meeting time listed

Instructor Permission Required

Peter Frumhoff

Who bears responsibility for climate change? Confronting this question is central to establishing equitable policies to reduce greenhouse gas emissions and limit the adverse impacts of now unavoidable climate disruption. International climate policy frameworks focus on the "common but differentiated responsibilities" of nations. But climate responsibilities also extend to non-state actors, including individuals, utilities and fossil-fuel companies at the base of the carbon supply chain whose responsibilities are increasingly the focus of attention by civil society, policymakers and the courts. This course examines the nature of climate responsibility from ethical, historical, scientific and policy perspectives and the efficacy of approaches to accelerate responsible climate action by both state and non-state actors.

The Technology, Economics, and Public Policy of Renewable Energy

2026 Spring (4 Credits)

T 0300 PM - 0545 PM

Instructor Permission Required

George Baker

Energy is the lifeblood of economic activity, indeed of human society. However, the planet's stores of easily accessed fossil fuels are limited, and the climatological cost of continuing to rely on fossil fuels is high. This course examines the long run and short run prospects for renewable energy. We start by understanding the technology of various renewables, including hydro, solar, wind, biomass, etc. We then examine the economics of

these technologies, and how policies (subsidies, taxes, regulations) affect their viability. Special attention will be paid to the twin challenges of electrification and decarbonization, and the implications of meeting these challenges for the operation and modernization of the electric grid.

Designing and Implementing International Environment, Climate, and Sustainability Solutions

Course ID: 226350

2025 Fall (4 Credits)

T 0945 AM - 1145 AM

Instructor Permission Required

Dustin Tingley

This course will analyze the design, implementation, and enforcement of global environment, climate, and sustainability policies. We will examine both historical cases as well as newly proposed policies. Throughout our focus will be on international policies involving multiple countries. However, insofar as countries enact domestic policies with significant international implications, we will also examine those. Students are expected to be active participants in our discussions given the seminar format.

US Environmental Policy and Policymaking: The Role of Congress, EPA, Stakeholders, and Courts

R 1200 PM - 0245 PM

Carrie Jenks

An introduction to environmental policy in the US with a focus on the Environmental Protection Agency. We will explore how policy is made at the federal and state levels and consider the actors who design policies, including legislators, agencies, advocates, regulated companies, and the courts. Through specific case studies, we will evaluate the policy options for environmental regulations and consider ways to measure whether a policy is successful. We will focus on a variety of environmental regulations including air quality, climate change, and clean water policies. We will also hear from policymakers and stakeholders to understand the challenges and opportunities for progress.

ESPP 171

Solid Waste In Developing Countries

MW 0300 PM - 0415 PM

Ken Thomas

This course will examine major issues of solid waste (i.e. production, management, storage, treatment, disposal,

Course ID: 220761
2025 Fall (4 Credits)

infrastructure costs and financing, policy) in the developing world at various geographic locations and scales across municipal, industrial, electronic, biological/medical, and radioactive waste. Specific solid waste issues will be highlighted through in-depth case studies from Africa, Asia, Central and South America, Middle East, and Small Island Developing States. Analysis of the environmental commitment and regulations, appropriate technology availability and reliability, and key geopolitical factors that affect the amount of solid waste to be handled and how it is disposed of will be explored in all cases. To understand fundamentals in the developing world context, the course will compare how solid waste is managed in the developed and developing world at the local, state, and federal levels. Fundamentals cut across solid waste-related policies, transport, sources, collection, disposal/treatment, recycling, and material recovery. The course will emphasize – both quantitatively and qualitatively – the real-world challenges and systemic issues of the developing world that make solid waste planning and management complicated.

FAS Divisional Distribution: Science & Engineering & Applied Science

ESPP 173

Water Resources in Developing Countries

MW 1200 PM - 0115 PM

Ken Thomas

This course will examine major issues of water resources (i.e. water sources, supply, quality, treatment, use, distribution and storage, policy) in the developing world at various geographic locations and scales. Specific water resources issues will be highlighted through in-depth case studies from Africa, Asia, and Small Island Developing States. Analysis of the hydrological, technological, legal, and geopolitical factors that affect the availability of water for human consumption and agriculture will be explored in all cases. To understand fundamentals in the developing world context, the course will compare how water resources are managed in the developed and developing world. Fundamentals cut across water-related policies, water flows, water sources, water supply, water and wastewater treatment, water distribution, and water storage. The course will emphasize – both quantitatively and qualitatively – the real-world challenges and systemic issues of the developing world that make water resources planning and management complicated.

Climate Change, Health, and Environmental Justice-Focusing on Solutions

No meeting time listed

Kari Nadeau

Course ID: 224042
2026 Spring (4 Credits)

Instructor Permission Required

Human health and the health of our planet are inextricably linked and they can be mutually beneficial. However, our planet's health and our health are at risk. Climate change represents one of the most pressing issues of our time, affecting every nation and person. In this class, we will focus on the ways in which climate change impacts human health and discuss approaches to quantify and mitigate these impacts at the local, state, national, and global levels. You will have the opportunity to monitor, measure, and analyze climate change associated data relevant to human health such as air pollution and temperature with devices we provide. You will also meet policy makers, community leaders, and community members who are addressing climate change impacts on human health. The overarching goal of the course is to critically discuss the health outcomes of energy production and climate change impacts on food, water, air, soil, food systems, and e-waste through the lens of social justice and health equity.

Environ Science & Engineering

ESE 6

Introduction to Environmental Science and Engineering

MW 1030 AM - 1145 AM

Steven Wofsy, Bryan Yoon

Course ID: 116362
2025 Fall (4 Credits)

This course will provide students with an introduction to environmental science and engineering by providing an

overview of current environmental issues, including climate change, air pollution, and water pollution. Students critically evaluate underlying science and knowledge limitations, and explore the nexus between scientific knowledge, regulatory frameworks, and engineering solutions to some of the world's most pressing environmental problems. The course will emphasize the interconnected biological, geological, and chemical cycles of the earth system including the multi-dimensional impacts of human activity.

Course Note: ESE 6 is also offered as EPS 6. Students may not take both for credit. This course requires students to choose a lab time during registration.

The course presumes basic knowledge in chemistry and physics at the high school level. Students will acquire additional skills and knowledge in these areas, as applied to environmental problems, as well as learning basic data analysis and coding skills.

Requires: Prerequisite/Co-requisite: Math 1B (or concurrent), or permission of the instructor

FAS Divisional Distribution: Science & Engineering & Applied Science

ESE 50

The Fluid Earth: Oceans, Atmosphere, Climate, and Environment

Course ID: 218887
2026 Spring (4 Credits)

MW 0900 AM - 1015 AM

Marianna Linz

This course introduces students to the fluid Earth, emphasizing Earth's weather and climate, the carbon cycle, and global environmental change. The physical concepts necessary for understanding the structure, motion and energy balance of the atmosphere, ocean, and cryosphere are covered first, and then these concepts are applied in exploring major earth processes. Examples from Earth's past history, on-going changes in the climate, and implications for the future are highlighted.

Course Note: Course includes lectures twice a week, a one hour section, and lab. ESE 50 is also offered as EPS 50. Students may not take both for credit. This course fulfills the EPS sub-discipline requirement of Atmosphere (s) and Oceans.

FAS Divisional Distribution: Science & Engineering & Applied Science

ESE 101

Global Warming Science 101

Course ID: 214500
2026 Spring (4 Credits)

W 0300 PM - 0545 PM

Eli Tziperman

An introduction to the science of global warming/climate change meant to assist students in understanding issues that often appear in the news and public debates. The course is meant for any STEM student with basic math preparation, not assuming prior science courses. Topics include the greenhouse effect and consequences of the rise of greenhouse gasses, including sea level rise, ocean acidification, heat waves, droughts, glacier melting, forest fires, expected changes to hurricanes, and more. An ability to critically evaluate observations, predictions, and risks will be developed throughout. The students will be guided in a hands-on, in-class quantitative analysis of climate observations, models, and feedbacks using provided Python Jupyter notebooks.

Course Note: This course fulfills the E-PSCI sub-discipline requirement of Atmosphere(s) and Oceans. E-PSCI 101 is also offered as ESE 101. Students may not take both for credit. For SB students: this course can only count as a science elective in the concentration requirements, and SB students must enroll in E-PSCI 101. AB students may enroll in either E-PSCI 101 or ESE 101 to meet their concentration requirements.

Basic calculus and ordinary differential equations, as covered, for example, by Math 19a or Math 21b or permission of instructor. Some previous exposure to programming (in any programming language) is assumed, and Python will be introduced as part of the course. The course will introduce the students to various science subjects, but no prior college-level science knowledge is assumed.

FAS Divisional Distribution: Science & Engineering & Applied Science

Quantitative Reasoning with Data: Yes

ESE 102

Data Analysis and Statistical Inference in the Earth and Environmental Sciences

Course ID: 217624
2025 Fall (4 Credits)

MW 0300 PM - 0415 PM

Roger Fu

Statistical inference, deterministic and stochastic models of data, denoising and filtering, data, visualization, time

series analysis, image processing, Monte Carlo methods. The course emphasizes hands-on learning using real data drawn from atmospheric and environmental observations, applied by students in projects and presentations.

Course Note: There is one half-day field trip to the Middlesex Fells to take data for the first of two projects. ESE 102 is also offered as EPS 102. Students may not take both for credit.

Math 21 or Applied Math 22 a and b or equivalent.

FAS Divisional Distribution: Science & Engineering & Applied Science

Quantitative Reasoning with Data: Yes

ESE 117

Introduction to Geospatial Analysis

TR 1200 PM - 0115 PM

Bryan Yoon

This course examines the fundamental basis of geospatial analysis and prepares students for further learning in remote sensing, advanced geospatial analysis, and spatial statistics. Focusing primarily on environmental datasets and questions, the course utilizes Python/R and QGIS to explore how spatial analysis can be used in environmental science, engineering, and management. This course is suited for students who want an accelerated introduction to geospatial analysis.

Course Note: Offered every other year.

Requires: Requirement: Must have completed COMPSCI 32, COMPSCI 50, APMTH10, SCI 5, STAT 110, or PHYSICI 12A. Cannot be taken for credit if GOV 1008 or GOV 1009 already complete.

Course ID: 226490
2026 Spring (4 Credits)

ESE 129

Climate and Atmospheric Physics Laboratory

R 1245 PM - 0330 PM

Marianna Linz

This course will take a hands-on approach to learning climate and atmospheric physics. Some of the topics covered will include the Greenhouse effect, hurricanes, climate variability, the jet stream, and global climate modeling. Students will learn to create effective data visualizations and read scientific literature. Each week will have one 165-minute session to perform laboratory experiments, run models, or analyze data. In this flipped-classroom environment, knowledge transfer will occur primarily outside of class through readings and pre-class assignments in preparation for each session.

Course Note: ESE 129 is also offered as EPS 129. Students may not take both for credit. For SB students: this course can only count as a science elective in the concentration requirements, and SB students must enroll in EPS 129. AB students may enroll in either EPS 129 or ESE 129 to meet their concentration requirements. This class meets in the Science and Engineering Complex (SEC) 1.216 EnviroLab on the Allston campus.

Physics 12a/15a/16, Math 21a (b strongly recommended) or equivalent or permission of instructor.

FAS Divisional Distribution: Science & Engineering & Applied Science

Course ID: 213669
2025 Fall (4 Credits)

ESE 131

Introduction to Physical Oceanography and Climate

TR 1030 AM - 1145 AM

Eli Tziperman

Observations and fundamentals of ocean dynamics, from the role of the oceans in climate change to beach waves. Topics include the greenhouse effect and the role of the oceans in global warming; El Niño events in the equatorial Pacific Ocean; the wind-driven ocean circulation and the Gulf Stream; coastal upwelling and fisheries; temperature, salinity, the overturning ocean circulation and its effect on global climate stability and variability; wave motions: surface ocean waves, internal waves, tsunamis, and tides; ocean observations by ships, satellites, moorings, floats and more. A field trip to the Woods Hole Oceanographic Institution on Cape Cod will be an opportunity to learn about sea-going oceanography. Students will be doing a group video project and group in-class presentations. Scientific computation and visualization methods will be introduced (students may choose either Matlab or Python) and will be used for some homework assignments.

Course Note: EPS 131 is also offered as ESE 131. Students may not take both for credit. This course fulfills the EPS sub-discipline requirement of Atmosphere(s) and Oceans. Given in alternate years.

Mathematics 21a, 21b; Physical Sciences 12a, Physics 15a or Applied Physics 50a; or equivalents/ permission

of instructor. Basic programming for scientific computation and graphics will be introduced (students may choose either Matlab or Python) and will be used for some homework assignments; no prior programming experience is assumed.

FAS Divisional Distribution: Science & Engineering & Applied Science

Quantitative Reasoning with Data: Yes

ESE 132

Introduction to Meteorology and Climate

MW 0900 AM - 1015 AM

Brian Farrell

Physical concepts necessary to understand atmospheric structure and motion. Phenomena studied include the formation of clouds and precipitation, solar and terrestrial radiation, dynamical balance of the large-scale wind, and the origin of cyclones. Concepts developed for understanding today's atmosphere are applied to understanding the record of past climate change and the prospects for climate change in the future.

Course Note: ESE 132 is also offered as EPS 132. Students may not take both for credit. Undergraduate Engineering Students should enroll in ESE 132. Previously ENG-SCI 132.

Mathematics 21 or Applied Mathematics 21a and 21b; Physical Sciences 12; or permission of instructor.

FAS Divisional Distribution: Science & Engineering & Applied Science

ESE 133

Atmospheric Chemistry

WF 1030 AM - 1145 AM

Daniel Jacob

Chemical and physical processes determining the composition of the atmosphere and its implications for air pollution, climate, and life on Earth. Emphasis is on the construction of engineering models and the application of chemical principles to understand and address current environmental issues. Nitrogen, oxygen, and carbon cycles. Climate forcing by greenhouse gases and aerosols. Stratospheric ozone. Oxidizing power of the atmosphere. Methane. Surface air pollution: aerosols and ozone. Deposition to ecosystems: acid rain, nitrogen, mercury.

Course Note: ESE 133 is also offered as EPS 133. Students may not take both for credit. Undergraduate engineering students should enroll in ESE 133.

Physical Sciences 11, Mathematics 1b, or equivalents.

FAS Divisional Distribution: Science & Engineering & Applied Science

ESE 135

Observing the Ocean: Measurements and Instrumentation

TR 0900 AM - 1015 AM

Fiamma Straneo

Is the ocean warming? Where and why is sea level rising? Where does the freshwater from Arctic ice melting go? Using real-world examples, this course will provide an overview of why and how we measure the ocean, focusing primarily on its physical properties. It will cover sensors, instruments and platforms, best field practices in data collection and calibration, fieldwork organization implementation, and ocean data analysis. During the course, students will build, test and calibrate an ocean profiling instrument. Students will participate in a one-day research cruise where they will collect data using both the instruments they built and other traditional oceanographic instruments

Course Note: This course includes a weekly 2-hour lab in Allston and two one-day field trips. ESE 135 is also offered as EPS 135. Students may not take both for credit.

The course is designed for upper-level undergraduates. There are no specific prerequisites but background in environmental or physical sciences; experience in coding (Python, R, or Matlab) or statistical analysis is recommended.

ESE 166Course ID: 161263
2026 Spring (4 Credits)**State-of-the-Art Harvard Climate Observatory and Associated Instrumentation**

MWF 0130 PM - 0245 PM

James Anderson

ESE/EPS 166 engages the new Harvard Climate Observatory that will fundamentally herald a new era in both climate research and the development of strategic approaches to advancing the climate impact on public policy. The central objective of the New Climate Observatory is to address this problem by introducing, for the first time, the development of a new generation of innovative technology that takes explicit advantage of recent major advances in Harvard-based instruments and optical designs in combination with advanced solar powered stratospheric aeronautical design. The new solar powered stratospheric aircraft that together constitute the Climate Observatory engage multiple recent design innovations in photovoltaics, energy storage, as well as guidance and control. Together these enable a combination of long duration solar powered observing systems, each targeted at the highest priority risk factors that threaten global societal stability. The resulting observations will, for the first time, provide the irrefutable evidence needed for quantitative forecasts of the dominant risk factors stemming from the global use of fossil fuels. While satellites have for years dominated the federal climate programs, for the purpose of developing tested and trusted quantitative forecasts of risk, satellites engender significant disadvantages. In sharp contrast to satellite systems, the new Harvard Climate Observatory provides, for the first time, orders of magnitude improvement in spatial and temporal resolution observations. ESE/EPS 166 will focus explicitly on this new generation of climate observations, forecasting, and resulting advances in public policy. An important part of the course is the display of Harvard flight instruments in the laboratory and the strategy for addressing unsolved scientific problems with new instrumentation.

Course Note: ESE 166 is also offered as EPS 166. Students may not take both for credit. This course integrates the challenges of climate scientific objectives with the strategy for instrument innovation and the lab is integrated with the course structure.

Math 1a, b; PS 11 or equivalent; PS 12a, b (or Physics 15a, b or AP 50a, b).

Requires: Prerequisite: Math 1b; Physical Sciences 1 or 11; and Physical Sciences 12a and 12b (or equivalents)

ESE 169

Course ID: 109341

Field and Lab-Based Seminar on Local Pollution Issues

2025 Fall (4 Credits)

TR 1030 AM - 1145 AM

*Instructor Permission Required**Elsie Sunderland*

This course provides a cross-disciplinary overview of environmental science and how research contributes to public policy and human health risk assessment through a case study of a local pollution issue. The course will focus on exposing students to a combination of field, lab and modeling techniques used in environmental sciences through an intensive study of factors affecting the bioaccumulation of contaminants on Cape Cod, MA. The class will include field visits, lab work, and interactive group research aimed at synthesizing research findings. Experience conducting multidisciplinary environmental research and data analysis will be provided. Course Activities: Lectures, discussions, presentations, field/lab research, data analysis.

Course Note: ESE 169 is also offered as EPS 169. Students may not take both for credit. Total class capacity of 18 is for both ESE 169 and EPS 169.

Two semesters of undergraduate chemistry including Physical Sciences 1 or Physical Sciences 11; Mathematics 1a & 1b. Knowledge of basic statistics is also helpful.

Requires: Prerequisite: Physical Sciences 1 or 11; and Math 1b

FAS Divisional Distribution: Science & Engineering & Applied Science

Ethnicity, Migration, Rights**Ethnicity, Migration, Rights**

EMR 154 (01)

Course ID: 220425

Migration, Refugees, and Human Rights

2025 Fall (4 Credits)

MW 1030 AM - 1145 AM

*Instructor Permission Required**Jacqueline Bhabha*

Migration is a central political and moral issue of our time and its impacts will continue to alter our world throughout this century. Indeed large scale, irregular human migration should be considered "the new normal", not an unexpected or one-off "crisis". It affects the lives of millions, unsettles established governments, creates sharply polarizing policy dilemmas and generates far-reaching administrative, economic and political challenges. This course will focus on distress migration, including refugee flight and other forms of forced displacement, evaluated through the lens of human rights. It will address the multifaceted drivers of the phenomenon, including the enduring legacies of colonization, armed conflict, environmental stress and climate change, global inequality, demographic pressures and increasing globalization. The course will also consider the impact of government responses to the COVID 19 pandemic on forced migrants. Migration actors from UN agencies, NGOs and other civil society organizations, and research experts working in a range of field sites will contribute to the class. The course will address the legal frameworks governing migration, and the ethical and pragmatic considerations that influence policies. It will explore the viability of a range of solutions to current migration challenges, including unequal access to protection, the failure of equitable resettlement and the erosion of host empathy/solidarity. The extent to which pandemic related measures conform to or violate legal and ethical obligations will also be considered. A key goal is to enable students to analyze current migration situations with clarity and rigor concerning the obligations of states and the rights of migrants. Using examples of large-scale contemporary population movements – the Ukrainian war and its human impact, the ongoing Tigrayan emergency, the Rohingya exodus, the Venezuelan context, the Mediterranean migration situation, extensive intra-regional mobility within the African continent, US/Mexico/Central American movements, unaccompanied child migration in many regions – the course will examine migration drivers, policy responses and rights challenges such as exclusion and denial of protection, persistent racism in border control, detention, prolonged confinement within refugee camps and forced repatriation. It will also engage with the multiple risks, including statelessness, trafficking, drowning, sexual violence, that migrants face before, during and after their journeys. The course will cover key current policy developments, at the municipal, national, regional and international level. The course will discuss seasonal migration, child migration, undocumented and irregular status, gender factors in migration and the role of xenophobia in driving policy. Students will be required to make in class presentations, to prepare questions for guest lecturers, and to participate in class discussion, including by considering a range of strategies for increasing access to safe mobility as a key redistributive global good. Undergraduate enrollment is limited to juniors and seniors.

FAS Divisional Distribution: Arts and Humanities

Mashpee and Harvard: Braided Histories

F 1000 AM - 0100 PM

Ann Braude

Course ID: 226439
2025 Fall (4 Credits)

Instructor Permission Required

Goals of self-governance and perseverance of the Mashpee Wampanoag Tribe's (MWT's) autonomy have intertwined with Harvard's founding educational and religious mission for 400 years. Collaboratively conceived with members of the MWT Historic Preservation Commission, this course explores indigenous, English, and American responses to the university's mandate to educate "English and Indian youth," in "knowledge and godliness." Reversing the longstanding practice of Wampanoag educators traveling to Harvard to help students understand the region in which they live and study, students will travel to Mashpee to engage the tribe and its institution. They will contribute to understanding of the braided histories of tribe and university through research on topics identified by the MWT Historic Preservation Commission, including indigenous sovereignty, land stewardship, and MWT access to education and control of Christian Institutions. The course includes day-long trips to Mashpee. Students should be prepared to be gone from Cambridge 9-5 on a few Fridays. Transportation will be provided. Enrollment limited to 25.

EMR 177 (1)

Queer/Cuir Latinidades: Film, Theatre, and Performance in the Americas

M 0300 PM - 0545 PM

Aitor Bouso Gavin

Course ID: 226438
2025 Fall (4 Credits)

Instructor Permission Required

This seminar examines the intersections of queer and cuir identities—the latter being a term that challenges Anglo-centrism through a decolonial lens—in U.S. Latinx and Latin American film, theatre, and performance. We will examine how artists, playwrights, and filmmakers interrogate dominant narratives of gender and sexuality, disrupt colonial and national imaginaries, and create spaces of resistance, relationality, and community. Through movies, plays, performances, and theoretical readings, we will engage with works by figures such as the Chicano playwright Luis Alfaro, the Latina/x performance artists Nao Bustamante and Carmelita Tropicana, or the Puerto Rican rapper Villano Antillano, among others. Key topics will include racialized queer aesthetics, trans* and nonbinary representation, the politics of spectacle and camp, and the role of performance in Black and Indigenous LGBTQIA+ social activism. Students will model a multidisciplinary, hemispheric, and decolonial approach, including queer of color critique, performance studies, and critical race theory, while also reflecting on contemporary movements and their cultural production. No prior knowledge is required, and students will have the opportunity to engage creatively with the material through writing, discussion, and optional performance-based assignments.

FAS Divisional Distribution: Arts and Humanities

EMR 178 (1)

Migration and Border Crossing in Film and Photography

WF 1200 PM - 0115 PM

Raquel Vega-Duran

Course ID: 226442
2025 Fall (4 Credits)

Instructor Permission Required

From an interdisciplinary perspective, this course explores the ways in which film and photography recount past and present human migrations, and how they contribute to and question the construction of the social imaginary of the migrant. Focusing on migrations particularly related to Spanish-speaking countries, we will examine themes such as "global" vs. "local"; conceptions of hybridity, otherness, belonging, border, assimilation, and neo-racism; the paradoxical nature of the "migrant"; the role of history, language, religion, and culture in the acceptance and rejection of foreigners; the relationship between border and identity; the feminization of migrations; the use of the term "illegal" in relation to migrations; and the emergence of "new" identities; among others. We will learn how to analyze the complexities of film and photography, considering movies, documentaries, photographs, and other visual materials which cover past and present migrations from Africa, America, Asia, and Europe. We will also study the history of migrations, and will examine the intricacies of the concept of migrant (as both emigrant and immigrant), paying particular attention to the different stages of migrants' journeys (the departure from the home country; the crossing of transit countries and borders; the arrival; and the settlement or forced deportation). No previous knowledge of film or photography required. This course will be conducted in Spanish.

FAS Divisional Distribution: Arts and Humanities

Introduction to Migration and Border Studies*No meeting time listed**Instructor Permission Required**Raquel Vega-Duran*

Introduction to Migration and Border Studies explores the construction of migration narratives through a humanistic lens. Rooted in the Humanities—the traditional home of storytelling—this course recognizes storytelling (broadly defined) as a powerful force in shaping our understanding of the world. We will examine migration through a wide range of methodological, theoretical, historical, geographical, and cultural perspectives, aiming to develop a nuanced and comprehensive understanding of the migration experience. This interdisciplinary course is taught by EMR Faculty Chair Raquel Vega-Durán and features contributions from six guest speakers. Each week, we will examine themes of borders and migration through a different disciplinary or artistic lens, including: narratology, literature, cartography, poetry, graphic novels, painting, art installations, music, philosophy, photography, narrative film, documentary film, and architecture.

Topics in Latinx Studies: Latinx Literature and Visual Culture

TR 1200 PM - 0115 PM

Aitor Bouso Gavin

This is a broad-based course that utilizes art and literature as political and historical tools of analysis. Students will be introduced to a variety of issues, debates, and methodologies which are central to Latinx studies. While engaging in a hands-on practice of self-inquiry and social critique, we will learn to model a comparative, intersectional, and transnational approach to study the work of influential Latinx writers, artists, and scholars. The class will facilitate contemporary discussions of cultural and political articulations of Latinidad. We will focus on key historical national and transhemispheric movements and events that have shaped the history of Latinx communities in the US such as 'El Movimiento' [Chicano Movement], the influx of Central American migration after prolonged civil wars and military interventions on the region, or the impact of NAFTA on the border. Given that Latinx creators often blur the boundaries of traditional literary, artistic, and scholarly genres, students will be working with works by diverse foundational figures which includes Afro-Nuyorican author Piri Thomas, queer Chicana multidisciplinary writer Gloria Anzaldúa and contemporary visual artists such as Firelei Báez and Guadalupe Maravilla. Topics addressed in the course will include: the history of U.S. imperialism in Latin America, transnational migration and the U.S.-Mexico border, the colonial legacies of anti-blackness, Latina feminism(s), or critical Latinx Indigeneities. The class is open and accessible to all students.

Instructor: Aitor Bouso Gavín, Lecturer in Latinx Studies.

FAS Divisional Distribution: Arts and Humanities

Topics in Native American and Indigenous Studies: Native North America

M 1200 PM - 0245 PM

Mandy Izadi

The first Americans met Europeans on their shores over five hundred years ago. They made the continent theirs millennia prior. And yet, Indigenous Americans are often missing, or misrepresented—in traditional, even contemporary portraits of North America. An introduction to the study of Native North America—and Native American and Indigenous Studies—this course provides a sweeping portrait of the histories and legacies of settler colonialism, war, dispossession, and slavery in the continent; it also reckons with contemporary issues, like reparations and the LandBack movement. Whenever possible, a global perspective will illuminate aspects of settler colonial states in places such as Australia, Finland, and Japan. More than anything, this sort of perspective will bring into view the magnitude of Indigenous power, resilience, and solidarity. Specific subjects of study include: land loss; Native culture and spirituality; inter-cultural and inter-ethnic relations; human-nature interactions; U.S. land management practices, including resource extraction; Indian law and legal violence; sovereignty and self-determination; decolonization and reparations; gender equity and human rights. This course prioritizes the perspectives, scholarship, and literature of Native Americans. True to the cross-disciplinary nature of NAIS, course material draws from academic literature as well as the arts; this includes, for instance, historical scholarship, legal studies, literature, film, and global history. Over the course of the term we will explore the ways in which these disciplines + the arts offer discrete approaches to the study of Native North America.

FAS Divisional Distribution: Arts and Humanities

Topics in Asian American Studies

TR 1030 AM - 1145 AM

Leslie Fernandez

This is an introductory course in Asian American studies centered around questions of identity and representation. We will familiarize ourselves with key frameworks and theoretical readings in Asian American studies and think about how what it means to be Asian American has been conceptualized and articulated by Asian Americans in relationship to political, social and cultural discourse. The course will pay particular attention to how pop culture has increasingly become an important and contested site of identity formation. The course looks at a wide range of contemporary Asian American texts in different genres to analyze how Asian Americans represent themselves and are represented in popular culture. We will consider how popular media engages and interacts with contemporary Asian American political and social issues: How do themes such as identity, migration, and diaspora manifest in these texts? How do Asian American artists leverage different mediums for their aesthetic and political goals? How do economic pressures and marketability shape the possibilities of Asian American art?

Course ID: 118262
2025 Fall (4 Credits)**Introduction to Expository Writing**

MW 0300 PM - 0415 PM

*Instructor Permission Required**Patricia Bellanca*

Topic: Expos Studio 10: Introduction

In Expos Studio 10, students practice analyzing sources, developing and organizing their ideas, and making arguments as they become familiar with the expectations of college writing. In small classes taking a hands-on approach, students work closely with instructors to learn strategies for drafting and revising clear, engaging essays. Students meet frequently in individual conferences with instructors to discuss their work, and the class also emphasizes collaborative work among students. In a small community of writers, students participate in workshops to discuss each other's work, thereby becoming more skillful at reading and revising their own writing. Assignments are based on sources from a range of disciplines and genres, and build in complexity so that students can master essential skills at each step. Expos Studio 10 focuses on academic essays as well as the personal statement required for fellowship or internship applications. Following Expos Studio 10, students take either Expos Studio 20 or an Expos 20 course to meet the writing requirement. All students meet with an Expos faculty member to discuss their course placement before enrolling.

Course Note: After taking Expos Studio 10, a student must pass Expository Writing 20 or Expos Studio 20 to meet the College's Expository Writing requirement.

Margaret Deli

Topic: Expos Studio 10: Introduction

In Expos Studio 10, students practice analyzing sources, developing and organizing their ideas, and making arguments as they become familiar with the expectations of college writing. In small classes taking a hands-on approach, students work closely with instructors to learn strategies for drafting and revising clear, engaging essays. Students meet frequently in individual conferences with instructors to discuss their work, and the class also emphasizes collaborative work among students. In a small community of writers, students participate in workshops to discuss each other's work, thereby becoming more skillful at reading and revising their own writing. Assignments are based on sources from a range of disciplines and genres, and build in complexity so that students can master essential skills at each step. Expos Studio 10 focuses on academic essays as well as the personal statement required for fellowship or internship applications. Following Expos Studio 10, students take either Expos Studio 20 or an Expos 20 course to meet the writing requirement. All students meet with an Expos faculty member to discuss their course placement before enrolling.

Course Note: After taking Expos Studio 10, a student must pass Expository Writing 20 or Expos Studio 20 to meet the College's Expository Writing requirement.

In a small community of writers, students participate in workshops to discuss each other's work, thereby becoming more skillful at reading and revising their own writing. Assignments are based on sources from a range of disciplines and genres, and build in complexity so that students can master essential skills at each step. Expos Studio 10 focuses on academic essays as well as the personal statement required for fellowship or internship applications. Following Expos Studio 10, students take either Expos Studio 20 or an Expos 20 course to meet the writing requirement. All students meet with an Expos faculty member to discuss their course placement before enrolling.

Course Note: After taking Expos Studio 10, a student must pass Expository Writing 20 or Expos Studio 20 to meet the College's Expository Writing requirement.

Taleen Mardirossian

Topic: Tongue-Tied

An intensive seminar that aims to improve each student's ability to discover and reason about evidence through the medium of essays. Each section focuses on a particular theme or topic, described on the Expos Website. All sections give students practice in formulating questions, analyzing both primary and secondary sources and properly acknowledging them, supporting arguments with strong and detailed evidence, and shaping clear, lively essays. All sections emphasize revision.

Course Note: Students must pass one term of Expository Writing 20 to meet the College's Expository Writing requirement.

Expository Writing 20

2026 Spring (4 Credits)

TR 1030 AM - 1145 AM

Instructor Permission Required

John Sampson

Topic: Expos Studio 20: The Successfu

An intensive seminar that aims to improve each student's ability to discover and reason about evidence through the medium of essays. Each section focuses on a particular theme or topic, described on the Expos Website. All sections give students practice in formulating questions, analyzing both primary and secondary sources and properly acknowledging them, supporting arguments with strong and detailed evidence, and shaping clear, lively essays. All sections emphasize revision.

Course Note: Students must pass one term of Expository Writing 20 to meet the College's Expository Writing requirement.

TR 1030 AM - 1145 AM

Instructor Permission Required

Jason Beckfield, Lene Hau

This course will introduce students to "wicked problems" in environment, climate and sustainability through case studies and engage students in finding solutions using interdisciplinary methods. The course will provide students with necessary tools and foundational skills to continue in a climate-focused concentration and Harvard.

Course Note: Primarily for first and second year students.

Topic: Applied Mathematics

This course provides academic credit when required in order to engage with a work or internship experience. Students will be asked to reflect upon their work and its relevance to their field of study via submission of a detailed portfolio. Eligibility: this course is open to any student who will be undertaking an internship, work, or lab-based research experience, for which academic credit is a requirement. Students must have completed at least two semesters of study at the College prior to enrolling, and they must be concentrating (or planning to do so) or pursuing a secondary field of study in the department. Students must enroll in EXPSTDY during the concurrent semester, or the semester immediately following the work/internship experience. Students cannot enroll in EXPSTDY after completion of their studies required for graduation. Students must complete the petition form available here before enrolling, and submit it to the OUE for approval. Students must then forward the signed documentation to the course head prior to enrolling in the course. This course is not available for concentration credit, nor does it fulfill any divisional distribution requirement. Academic Requirements: before the end of the semester, students should submit a 10-15 page portfolio that must include the following: - A description of the organization, including its mission and core operations. - A detailed description of the student's role or project in the organization's operations, including daily activities and descriptions of any special projects or events with which the student was involved. Students may utilize a journal format for this description; no more than half of the overall portfolio may be journal entries reflecting on the connection between their work and their concentration. - A detailed description of how the work/internship experience was related to the student's concentration, and what impact the work experience will have on the student's academic path through that concentration. - A letter from the employer or lab supervisor verifying completion of the work experience. - A grade of Pass will be assigned after all the above materials have been reviewed. If these requirements are not met, a grade of Fail will be assigned.

Students cannot enroll in EXPSTDY after completion of their studies required for graduation. Students must complete the petition form available here before enrolling, and submit it to the OUE for approval. Students must then forward the signed documentation to the course head prior to enrolling in the course. This course is not available for concentration credit, nor does it fulfill any divisional distribution requirement. Academic Requirements: before the end of the semester, students should submit a 10-15 page portfolio that must include the following: - A description of the organization, including its mission and core operations. - A detailed description of the student's role or project in the organization's operations, including daily activities and descriptions of any special projects or events with which the student was involved. Students may utilize a journal format for this description; no more than half of the overall portfolio may be journal entries reflecting on the connection between their work and their concentration. - A detailed description of how the work/internship experience was related to the student's concentration, and what impact the work experience will have on the student's academic path through that concentration. - A letter from the employer or lab supervisor verifying completion of the work experience. - A grade of Pass will be assigned after all the above materials have been reviewed. If these requirements are not met, a grade of Fail will be assigned.

This course provides academic credit when required in order to engage with a work or internship experience. Students will be asked to reflect upon their work and its relevance to their field of study via submission of a detailed portfolio. Eligibility: this course is open to any student who will be undertaking an internship, work, or lab-based research experience, for which academic credit is a requirement. Students must have completed at least two semesters of study at the College prior to enrolling, and they must be concentrating (or planning to do so) or pursuing a secondary field of study in the department. Students must enroll in EXPSTDY during the concurrent semester, or the semester immediately following the work/internship experience. Students cannot enroll in EXPSTDY after completion of their studies required for graduation. Students must complete the petition form available here before enrolling, and submit it to the OUE for approval. Students must then forward the signed documentation to the course head prior to enrolling in the course. This course is not available for concentration credit, nor does it fulfill any divisional distribution requirement. Academic Requirements: before the end of the semester, students should submit a 10-15 page portfolio that must include the following: - A

description of the organization, including its mission and core operations. - A detailed description of the student's role or project in the organization's operations, including daily activities and descriptions of any special projects or events with which the student was involved. Students may utilize a journal format for this description; no more than half of the overall portfolio may be journal entries reflecting on the connection between their work and their concentration. - A detailed description of how the work/internship experience was related to the student's concentration, and what impact the work experience will have on the student's academic path through that concentration. - A letter from the employer or lab supervisor verifying completion of the work experience. - A grade of Pass will be assigned after all the above materials have been reviewed. If these requirements are not met, a grade of Fail will be assigned.

Topic: Theater, Dance & Media

This course provides academic credit when required in order to engage with a work or internship experience. Students will be asked to reflect upon their work and its relevance to their field of study via submission of a detailed portfolio. Eligibility: this course is open to any student who will be undertaking an internship, work, or lab-based research experience, for which academic credit is a requirement. Students must have completed at least two semesters of study at the College prior to enrolling, and they must be concentrating (or planning to do so) or pursuing a secondary field of study in the department. Students must enroll in EXPSTDY during the concurrent semester, or the semester immediately following the work/internship experience. Students cannot enroll in EXPSTDY after completion of their studies required for graduation. Students must complete the petition form available here before enrolling, and submit it to the OUE for approval. Students must then forward the signed documentation to the course head prior to enrolling in the course. This course is not available for concentration credit, nor does it fulfill any divisional distribution requirement. Academic Requirements: before the end of the semester, students should submit a 10-15 page portfolio that must include the following: - A description of the organization, including its mission and core operations. - A detailed description of the student's role or project in the organization's operations, including daily activities and descriptions of any special projects or events with which the student was involved. Students may utilize a journal format for this description; no more than half of the overall portfolio may be journal entries reflecting on the connection between their work and their concentration. - A detailed description of how the work/internship experience was related to the student's concentration, and what impact the work experience will have on the student's academic path through that concentration. - A letter from the employer or lab supervisor verifying completion of the work experience. - A grade of Pass will be assigned after all the above materials have been reviewed. If these requirements are not met, a grade of Fail will be assigned.

Experiential Study

2025 Fall (1 Credits)

No meeting time listed

Instructor Permission Required

Liam Hynes-Tawa

Topic: Music

This course provides academic credit when required in order to engage with a work or internship experience. Students will be asked to reflect upon their work and its relevance to their field of study via submission of a detailed portfolio. Eligibility: this course is open to any student who will be undertaking an internship, work, or lab-based research experience, for which academic credit is a requirement. Students must have completed at least two semesters of study at the College prior to enrolling, and they must be concentrating (or planning to do so) or pursuing a secondary field of study in the department. Students must enroll in EXPSTDY during the concurrent semester, or the semester immediately following the work/internship experience. Students cannot enroll in EXPSTDY after completion of their studies required for graduation. Students must complete the petition form available here before enrolling, and submit it to the OUE for approval. Students must then forward the signed documentation to the course head prior to enrolling in the course. This course is not available for concentration credit, nor does it fulfill any divisional distribution requirement. Academic Requirements: before the end of the semester, students should submit a 10-15 page portfolio that must include the following: - A description of the organization, including its mission and core operations. - A detailed description of the student's role or project in the organization's operations, including daily activities and descriptions of any special projects or events with which the student was involved. Students may utilize a journal format for this description; no more than half of the overall portfolio may be journal entries reflecting on the connection between their work and their concentration. - A detailed description of how the work/internship experience was related to the student's concentration, and what impact the work experience will have on the student's academic path through that concentration. - A letter from the employer or lab supervisor verifying completion of the work experience. - A grade of Pass will be assigned after all the above materials have been reviewed. If these requirements are not met, a grade of Fail will be assigned.

First Year Seminar Program

First Year Seminar

FYSEMR 21I

Evolution, Buddhism and Ethics

W 1245 PM - 0245 PM

John Wakeley

Course ID: 226239

2026 Spring (4 Credits)

Instructor Permission Required

Evolutionary genetics traces back to Darwin's (1859) idea of natural selection. Darwin provided a compelling theory about how species change due to competition in reproducing populations, yet it remains difficult to understand, particularly when applied to ourselves. To enable critical evaluation and discussion of ethical questions and to illustrate connections between science and Buddhism, about one third of this seminar will cover select details of evolutionary genetics. The focus will be on understanding human genetic variation. Buddhism originated with Siddhartha Gautama's enlightenment around 500 BCE, achieved after six years of intense devotion to the problem of human suffering. He emerged as the Buddha, or the Enlightened One, making the bold statement that suffering within each person results from misunderstanding the nature of one's self and its relationship to the ever-changing world. He outlined a program of analytical introspection, morality, and meditation, aimed at solving this problem. As with evolutionary genetics, critical evaluation and discussion of Buddhist ideas in this seminar will be fostered by learning the details of what the Buddha taught. Points of overlap between evolutionary genetics and Buddhism emerge in the ways they undermine appearances, deconstructing phenomena which at first appear wholly unbreakable. We will bring our knowledge of Buddhism to bear on end-of-life issues, the use of human embryos in research, and the prospects for human genetic engineering.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 5 pm on Mon, August 11. If you are unsuccessful in the lottery, you may still join any seminar with open seats. A list of open seminars and instructions on next steps will be available on the First-Year Seminar Program website August 11 at 12 Noon.

FYSEMR 21V

Black Holes, String Theory and the Fundamental Laws of Nature

W 0600 PM - 0800 PM

Andrew Strominger

Course ID: 109627
2025 Fall (4 Credits)

Instructor Permission Required

The quest to understand the fundamental laws of nature has been ongoing for centuries. This seminar will assess the current status of this quest. In the first five weeks we will cover the basic pillars of our understanding: Einstein's theory of general relativity, quantum mechanics and the Standard Model of particle physics. We will then examine the inadequacies and inconsistencies in our current picture, including for example the problem of quantum gravity, the lack of a unified theory of forces, Dirac's large numbers problem, the cosmological constant problem, Hawking's black hole information paradox, and the absence of a theory for the origin of the universe. Attempts to address these issues and move beyond our current understanding involve a network of intertwined investigations in string theory, M theory, inflation and non-abelian gauge theories and have drawn inspiration from the study and observation of black holes, gravitational waves and developments in modern mathematics. These forays beyond the edge of our current knowledge will be reviewed and assessed.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. FYSEMR 21W

Research at the Harvard Forest—Global Change Ecology: Forests, Ecosystem Function, the Future

No meeting time listed

David Orwig

Course ID: 112349
2025 Fall (4 Credits)

Instructor Permission Required

The seminar will consist of three weekend field trips (Friday evening through Sunday afternoon) to Harvard Forest and a final mini symposium (Sunday afternoon to Monday afternoon) at the Harvard Forest. The seminar will acquaint students with our current knowledge about global change, drawing upon state-of-the-art research, tools, and measurements used in evaluating and predicting climate change through ongoing studies at the Harvard Forest's 4,000-acre outdoor classroom and laboratory in Petersham, Massachusetts. Students will spend the weekends at the Harvard Forest (HF) in comfortable accommodations with round-trip travel and meals provided. Through readings, informal discussions, and field excursions, students will become versed in the ecological concepts related to global change, and the science behind current predictions for future climate scenarios. September 12-14, October 10-12, November 7-9, December 8 (final on-campus meeting) Through the three weekends we will broadly discuss the critical role that forests play in a changing climate, with in-depth discussions on specific topics such as carbon dioxide emissions, invasive species, and forecasting the future with ecological data. Visits to various long-term ecological experiments and associated infrastructure will show students how climate change impacts are assessed, and discussions will emphasize how scientists predict future climate change through modeling. Students will prepare a written exercise following each weekend based on the topics discussed and will work on a final paper and presentation for a mini symposium on the last day of

class. The field trip format is intended to immerse students in an active field research setting and to allow extended small group discussion and interaction with a number of leading global change scientists at one of the preeminent field research sites in the U.S. Students will come away with an understanding of the types of ecological evidence for global warming and will be able to explain, to a broad audience, some of the major scientific methods used in predicting its consequences.

Course Note: The first class only will meet on Tues, Sept 2, 9:30-11:30am in a location TBD.

PLEASE NOTE: due to the seminar format of the weekends and a final symposium, students MUST be able to attend all class dates, SEPT 12-14, OCT 10-12, NOV 7-9. The Final Symposium will be on Dec 8. Transportation, accommodations, and meals at the Harvard Forest will be provided at no cost to the student.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 5 pm on Mon, August 11. If you are unsuccessful in the lottery, you may still join any seminar with open seats. FYSEMR 22H

My Genes and Cancer

R 0345 PM - 0545 PM

Giovanni Parmigiani

Course ID: 159990

2026 Spring (4 Credits)

Instructor Permission Required

The effect of a person's genetic background on whether they will develop cancer, and when, is at the center of scientific and societal dilemmas which will be explored in this seminar. The seminar will include a brief didactic phase, followed by student-led learning activities and by final debates, moderated by students. Learning will cover genetic inheritance of cancer; cancer evolutionary theories; conceptual and technical notions of probability and risk; and their use in personalized medicine. Debates will emerge from the student's interest. Examples may include: should we test all children at birth? Should we research methods for editing genetic susceptibility to cancer out of embryos? Should race be part of the construction of personalized cancer risk? NASA is both an employer and a health care provider for astronauts: space missions increase astronauts' risk of cancer; should NASA test astronauts for inherited susceptibility to cancer, and how should they use the information?

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 5 pm on Mon, August 11. If you are unsuccessful in the lottery, you may still join any seminar with open seats. A list of open seminars and instructions on next steps will be available on the First-Year Seminar Program website August 11 at 12 Noon.

There are no strict prerequisites, though some familiarity with the basic concepts of probability and genetics will be very helpful.

FYSEMR 23C

Exploring the Infinite

W 0345 PM - 0545 PM

Peter Koellner

Course ID: 224563

2025 Fall (4 Credits)

Instructor Permission Required

Infinity captivates the imagination. A child stands between two mirrors and sees herself reflected over and over again, smaller and smaller, trailing off to infinity. Does it go on forever? ... Does anything go on forever? Does life go on forever? Does time go on forever? Does the universe go on forever? Is there anything that we can be certain goes on forever? ... It would seem that the counting numbers go on forever, since given any number on can always add one. But is that the extent of forever? Or are there numbers that go beyond that? Are there higher and higher levels of infinity? And, if so, does the totality of all of these levels of infinity itself constitute the highest, most ultimate, level of infinity, the absolutely infinite? In this seminar we will focus on the mathematical infinite. We will start with the so-called "paradoxes of the infinite", paradoxes that have led some to the conclusion that the concept of infinity is incoherent. We will see, however, that what these paradoxes ultimately show is that the infinite is just quite different than the finite and that by being very careful we can sharpen the concept of infinity so that these paradoxes are transformed into surprising discoveries. We will follow the historical development, starting with the work of Cantor at the end of the nineteenth century, and proceeding up to the present. The study of the infinite has blossomed into a beautiful branch of mathematics. We will get a

glimpse of this subject, and the many levels of infinity, and we will see that the infinite is even more magnificent than one might ever have imagined.

First-Year Seminars are available only to first-year students. FYSEMR 23H

Medicine in Nazi Germany and the Holocaust—Anatomy as Example for Changes in Medical Science

Course ID: 160215
2026 Spring (4 Credits)

M 0300 PM - 0500 PM

Instructor Permission Required

Sabine Hildebrandt

The full title of this seminar is Medicine in Nazi Germany and the Holocaust—Anatomy as Example for Changes in Medical Science from Routine to Murder. This seminar introduces students to the history of Nazi Germany and the Holocaust as an extreme example of antisemitism and racism, and of crimes against humanity and genocide. These included medical crimes, which, thus far, are the most thoroughly documented examples of ethical transgressions of health care professionals. They include forced sterilizations, the "euthanasia" systematic patient murder program, and forced brutal medical experiments on the living and the dead. However, under conditions of oppression by the same political system, some health care professionals chose to retain the healing powers of medicine. Anatomy in Nazi Germany is an example of ethical transgressions in the medical sciences that reveals the complex relationships between scientists and the Nazi regime. Changes of the traditional anatomical body procurement manifested in the use of many bodies of Nazi victims in teaching and scientific investigations. Research gradually moved from routine studies to murder, from the anatomy lab to the Nazi prison system and then to the concentration camps. Ultimately, anatomists were complicit with the government through their role in the complete destruction of the perceived "enemies" of the Nazi regime. This history of medicine can thus serve as a model for the recognition of patterns and common roots with other histories of discrimination, oppression, and atrocities. Also, there are continuities and legacies from this history that reach into the present and have relevance for today's education and practice in the health professions.

Course Note: To students interested in applying to FYSEMR 23H: Medicine in Nazi Germany and the Holocaust—Your application to this seminar should state your interest and previous exposure to this topic. This text does not have to be perfectly worded or long, but be written by you rather than a generative AI tool. Use of generative AI in this context is discouraged by Dr. Hildebrandt, as she really wants to hear from you personally, and not read a standard text on the topic.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. FYSEMR 23I

Earth Science Goes to the Movies: Math and Physics of Natural (?) Disasters

Course ID: 160219
2025 Fall (4 Credits)

W 0300 PM - 0545 PM

Instructor Permission Required

Miaki Ishii

Natural disasters such as earthquakes, tsunamis, tornadoes, hurricanes, and volcanic eruptions can have devastating effects on society, but are often over-exaggerated for the silver screen. How can we tell what is believable and what is not? Participants in this seminar will watch one Earth-science related movie each week, will learn background about the science behind the natural disasters portrayed on film, and then will apply math and physics concepts and equations to develop "back-of-the-envelope" calculations that assess realism. The movies will be complemented with Role-Playing Games to gain insight into the complexities of mitigating natural disasters. Students will be exposed to a wide variety of Earth-science topics and should walk away not only with the ability to point out flaws on-screen, but also the ability to explain natural phenomena in the world around them. For J-Term-Wintersession (January 5-23): The Seminar includes a component designed to prepare students for research participation, culminating in an optional, not-for-credit J-term module. The module will run from Monday January 5th to Friday January 23rd, and will be at no cost to the students. During this module,

students will engage in paid research activities within the Department of Earth & Planetary Sciences and learn research skills through mini-workshops. Please visit the Seminar Site for further details on the J-Term component of this Seminar.

Course Note: Students are expected to attend Tuesday evening movie viewing sessions (time TBD). This seminar is highly participatory and collaborative, and students should be ready to engage not only with the material, but also with one another.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 5 pm on Mon, August 11. If you are unsuccessful in the lottery, you may still join any seminar with open seats. A list of open seminars and instructions on next steps will be available on the First-Year Seminar Program website August 11 at 12 Noon.

Students must be comfortable with high-school level math and science.

Requires: Course open to First-Year Students Only

FYSEMR 23K

Insights from Narratives of Illness

R 1245 PM - 0245 PM

Jerome Groopman

Course ID: 117969

2026 Spring (4 Credits)

Instructor Permission Required

A physician occupies a unique perch, regularly witnessing life's great mysteries: the miracle of birth, the perplexing moment of death, and the struggle to find meaning in suffering. It is no wonder that narratives of illness have been of interest to both physician and non-physician writers. This seminar will examine and interrogate both literary and journalistic dimensions of medical writing. The investigation will be chronological, beginning with "classic" narratives by Tolstoy, Chekhov, and Kafka, and then moving on to more contemporary authors such as William Carlos Williams, Richard Selzer, Oliver Sacks, Susan Sontag, and Philip Roth. Controversial and contentious subjects are sought in these writings: the imbalance of power between physician and patient; how different religions frame the genesis and outcome of disease; the role of quackery, avarice, and ego in molding doctors' behavior; whether character changes for better or worse when people face their mortality; what is normal and what is abnormal behavior based on culture, neuroscience, and individual versus group norms. The presentation of illness in journalism will be studied in selected readings from the New York Times' and Boston Globe's Science sections, as well as periodicals like the New Yorker, The New York Review of Books, Harper's, and the Atlantic Monthly. The members of the seminar will analyze how the media accurately present the science of medicine or play to "pop culture." The seminar will study not only mainstream medical journalists, but so called alternative medical writers such as Andrew Weil and celebrity health voices like Gwyneth Paltrow. Patients with different diseases will be invited to speak to the members of the seminar about their experiences. Students will try their hands at different forms of medical writing, such as an editorial on physician-assisted suicide that would appear in a newspaper and a short story that describes a personal or family experience with illness and the medical system.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 5 pm on Mon, August 11. If you are unsuccessful in the lottery, you may still join any seminar with open seats. A list of open seminars and instructions on next steps will be available on the First-Year Seminar Program website August 11 at 12 Noon.

Physics, Math and Puzzles

R 0600 PM - 0800 PM

C. Vafa

Course ID: 224490

2026 Spring (4 Credits)

Instructor Permission Required

Physics is a highly developed branch of science with a broad range of applications. Despite the complexity of the universe the fundamental laws of physics are rather simple, if viewed properly. This seminar will focus on intuitive as well as mathematical underpinnings of some of the fundamental laws of nature. The seminars will use mathematical puzzles to introduce the basic features of physical laws. Main aspects discussed include the role of symmetries as well as the power of modern math, including abstract ideas in topology, in unraveling the mysteries of the universe. Examples are drawn from diverse areas of physics including string theory. The issue of why the universe is so big, as well as its potential explanation is also discussed.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026

First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 5 pm on Mon, August 11. If you are unsuccessful in the lottery, you may still join any seminar with open seats. A list of open seminars and instructions on next steps will be available on the First-Year Seminar Program website August 11 at 12 Noon.

This seminar is recommended for students with a strong background in both math and physics and with keen interest in the relation between the two subjects.

FYSEMR 23S

The Seven Sins of Memory

M 0300 PM - 0500 PM

Daniel Schacter

Course ID: 117972

2026 Spring (4 Credits)

Instructor Permission Required

How do we remember and why do we forget? Can we trust our memories? How is memory affected by misinformation such as "fake news"? Do smartphones and the Internet help our memories or hurt them? Are traumatic experiences especially well remembered or are they poorly remembered? What are the best ways to study for exams? This seminar will address these and other questions related to the fallibility of memory by considering evidence from studies of healthy people with normal memories, brain-damaged patients who show dramatic forgetting or striking memory distortions, and neuroimaging studies that reveal brain regions and networks that are linked to memory. The framework for the seminar is provided by the idea that the misdeeds of memory can be classified into seven basic "sins". Three of the memory sins refer to different kinds of forgetting (transience, absent-mindedness, and blocking), three refer to different kinds of distortions or false memories (misattribution, suggestibility, and bias) and the final sin refers to intrusive recollections (persistence). We will consider how the memory sins impact everyday life and discuss the possibility that they can be conceptualized as by-products of adaptive features of memory, rather than as flaws in the system or blunders made by Mother Nature during evolution. Relatedly, we will also discuss the interplay between remembering past experiences and imagining future experiences, which provides clues regarding the nature and fallibility of memory.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 10am on Mon, August 11th. If you are unsuccessful in the lottery, you may still join any seminar with open seats. A list of open seminars and instructions on next steps will be available on the First-Year Seminar Program website August 11th at 12 Noon.

Requires: Course open to First-Year Students Only

FYSEMR 23Y

All Physics in 13 Days

M 0645 PM - 0845 PM

John Doyle

Course ID: 109575

2026 Spring (4 Credits)

Instructor Permission Required

Some claim that there are 13 ideas or principles that can form the bedrock for a pretty good understanding of our physical and technological world. These are: 1) Boltzmann factor and thermal equilibrium, 2) Turbulence, 3) Reaction rates, 4) Indistinguishable particles, 5) Quantum waves, 6) Linearity, 7) Entropy and information, 8) Discharges, ionization, 9) Relativity, 10) Nuclear binding energies, 11) Photon modes, 12) Diffraction, 13) Resonance. Each week we will discuss one of these principles and see how they explain certain things about the physical world. We will discuss these and connections with other principles, as well as how the principle shows up in technology and, more broadly, in our technological society.

Course Note: The meeting time will be determined according to enrolled students' availability.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 10am on Mon, August 11th. If you are unsuccessful in the lottery, you may still join any seminar with open seats. A list of open seminars and instructions on next steps will be available on the First-Year Seminar Program website August 11th at 12 Noon.

This seminar is restricted to students that very likely will major in physics or chem/physics. In their application, students should provide their planned courses for the fall semester. This course will treat several key principles with the expectation that students will encounter them in a more extensive, more formal way in an advanced physics course. Topics may change.

Requires: Course open to First-Year Students Only

FYSEMR 24G

A Brief History of Surgery

R 0600 PM - 0800 PM

Frederick Millham

Course ID: 127976

2025 Fall (4 Credits)

Instructor Permission Required

Was Surgery practiced in the Stone Age? Twenty six hundred years ago at the dawn of recorded history, Egyptian surgeons operated on patients by the shores of the Nile. What diagnoses were they making? What treatments did they offer? How did they understand human anatomy and physiology? A millennium later, the Hippocratic physicians emerged on the Aegean Island of Cos. These physicians left us carefully stated surgical principles based, at least partly, on observation and measurement. Why did they record their wisdom in the form of aphorisms? At around the same time, Shushruta, in what is now India, appears to have offered surprisingly modern surgical care to his patients. Who was he? In the second century CE Galen of Pergamum bursts on to the scene, intending to restore Hippocratic orthodoxy. Why was surgical thinking for nearly two millennia dominated by this his, often erroneous, teaching? The Islamic Golden Age, an explosion of scientific and medical discovery, is a key to our understanding of all that follows in surgical history. Why is this period overlooked today? How did the exposure of Galen's anatomical imprecision by Vesalius in 1543 and his absurd physiology by Harvey in 1628 begin a Medical Enlightenment? Why did it take until the 19th century for surgeons solve the riddles of anesthesia and antisepsis? What were the roles of surgeons in the Eugenics movement and the Holocaust? Is the advice of the Hippocratic physicians that "To understand surgery one must go to war" true in the 21st Century? Our study will examine these questions and many more. We will visit the site of the first use of ether anesthesia and explore the human body in the anatomy lab at Harvard Medical School. We will admire rare first additions of the great works of surgical history at the Countway Medical Library. From time to time we will be joined by doctors with expertise in specific areas such as anesthesiology, combat surgery, and anatomy.

Course Note: The seminar will visit the site of the first use of ether anesthesia (the Ether Dome) and explore the human body in the anatomy lab at Harvard Medical School. We will admire rare first additions of the great works of surgical history at the Countway Medical Library. From time to time we will be joined by doctors with expertise in specific areas such as anesthesiology, combat surgery, and anatomy.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 5 pm on Mon, August 11. If you are unsuccessful in the lottery, you may still join any seminar with open seats. A list of open seminars and instructions on next steps will be available on the First-Year Seminar Program website August 11 at 12 Noon.

FYSEMR 24U

"How Did I Get Here?"—Appreciating "Normal" Child Development

T 0345 PM - 0545 PM

Laura Prager

Course ID: 128122

2026 Spring (4 Credits)

Instructor Permission Required

Understanding "normal" growth and development may seem like a relatively easy task at first. We take the nuances of developmental differences for granted because we're so accustomed to experiencing them. Nevertheless, defining normal (versus abnormal) development is a complex and controversial task. Development involves a tricky intermingling of environmental stimuli, cultural and social expectations, rapid and not always intuitive changes in brain development, temperamental differences, genetic inheritance, and mind-boggling brain plasticity. The seminar will start with a consideration of general themes and then move to a chronologic perspective. First, we approach child development as a dynamic force, one which simultaneously engages multiple domains: social/relational, cognitive, physical, moral. We will then switch to examine stages of development in sequence, using our understanding of neurobiological, physical, cultural, and psychological factors to inform our assessment of how children change over time. Readings will include classic papers on development, textbook chapters that provide overviews of specific developmental stages, recently published research articles on genetic inheritance, selected contemporary children's and young adult literature, personal memoirs, and short stories written about childhood.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. Finding Connections: Perspectives on Psychological Development and Mental Illness

2025 Fall (4 Credits)

T 0300 PM - 0500 PM

Instructor Permission Required

Nancy Rappaport

The seminar's challenge will be to deepen our understanding of human development and how individuals cope with serious emotional or social difficulties (neglect, bipolar disorder, autism, depression, schizophrenia). We will use multiple perspectives: medical observations and texts that provide practical knowledge (e.g. The New England Journal of Medicine review articles), narrative readings to understand how patients experience the meaning of illness from the inside out (e.g. The Center Cannot Hold), visitors who will discuss their experience with mental illness, and how development-related mental illness is portrayed in the press (e.g. The New Yorker articles). We will start with the mental life of babies and how scientists interpret infants' nonverbal ways of finding safety and security. This begins the journey of our understanding fundamental needs for tenderness, holding, and making meaning. Understanding how conditions such as autism, depression, and schizophrenia are described in clinical research and literature will help us to appreciate the biological vulnerabilities and relational patterns that may disrupt the human connection. We will examine the resourcefulness required for both fragility and resiliency. Throughout the seminar, the instructor, as a practicing child and adolescent psychiatrist, will bridge the gap between research findings, clinical applications, and everyday insight.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. The Universe's Hidden Dimensions

2025 Fall (4 Credits)

M 0300 PM - 0500 PM

Instructor Permission Required

Lisa Randall

This seminar will give an overview and introduction to modern physics and cosmology. As with the books, Warped Passages, Knocking on Heaven's Door, Higgs Discovery, and Dark Matter and the Dinosaurs, on which it will be loosely based, the seminar will consider important developments in physics today and in the last century. We will consider the revolutionary developments of quantum mechanics and general relativity; and will investigate the key concepts which separated these developments from the physical theories which previously existed. We will then delve into modern particle physics and cosmology and how theory and experiment culminated in the "Standard Model of particle physics" which physicists use today as well as the current cosmological model based on the Big Bang theory and inflation. We will also move beyond the standard theories into more speculative arenas, including supersymmetry, string theory, and theories of extra dimensions of space, as well as ideas about the nature of dark matter and black holes. We will consider the motivations underlying these theories, their current status, and how we might hope to test some of the underlying ideas in the near future.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. Transformative Ideas in Brain Science: War, Technology, and Disease Pioneered Discovery

2025 Fall (4 Credits)

Jeffrey Macklis

This seminar will offer an integrated historical-neurobiological-neurological introduction to foundational and transformative ideas in the ~3,700 year history of brain science, neuroscience, and "lay" neurology—all accessible to freshmen with interests from neuroscience and (molecular, developmental, organismic, evolutionary, or regenerative) biology to history and philosophy of science to neuroeconomics and medicine. No background will be assumed. Rather, a series of historical vignettes and sources will be tied to modern understanding of core elements of the nervous system, its organization, function, and modes of investigation and manipulation. Selected historical contexts, often involving war, disease, serendipity, and technology advancement, will be highlighted as advancing knowledge in surprising ways. An inter-disciplinary approach will benefit from each student bringing insights from their own reading of primary source and history of science texts, to be added to in-session discussion, with moderation and direction from me (JDM). We will visit a number of the Harvard Collections and museums, including the Museum of Comparative Zoology, Harvard Herbaria, Houghton Rare Books Library, History of Science Collections, the HMS Warren Anatomical Museum collection (Phineas Gage's skull and railroad tamping rod, among much more), the Harvard collection of historical scientific instruments (advances in microscopy, electrical measurement, e.g.), and the state-of-the-art Center for Brain Science human functional brain imaging facility, with each visit providing context for the week.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. Digging Egypt's Past: Harvard and Egyptian Archaeology

2025 Fall (4 Credits)

T 0945 AM - 1145 AM

Instructor Permission Required

Peter Manuelian

Mysterious pyramids, colossal royal statues, tiny gold jewelry, decorated tomb chapels, temples, settlements, fortresses, and hieroglyphic inscriptions. This was the excavation legacy in Egypt and Sudan of the Harvard University–Boston Museum of Fine Arts (MFA) Expedition. Led by Egyptologist George Reisner (1867–1942; new biography just published), this expedition revolutionized archaeological method, and put Harvard Egyptology on the world stage, all during British control of the Egyptian government, French control of Egyptian antiquities, and Egyptian yearning for independence. This seminar explores 20th century and modern archaeology and Egyptology, racism and decolonization in cultural heritage, Harvard and MFA history, museology and artifact repatriation. Students will access unpublished archival documents at Harvard and elsewhere, and will research important expedition sites, staff members and momentous discoveries.

Course Note: Circumstances permitting, field trips to the Peabody Museum, the MFA, Harvard's Visualization Center (Giza Pyramids in 3D), and the Harvard Museum of the Ancient Near East, will bring the HU-MFA Expedition to life.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. Death and Immortality

M 1245 PM - 0245 PM

Instructor Permission Required

Cheryl Chen

In this seminar, we will discuss philosophical questions about death and immortality. What is death? Is there a moral difference between "brain death" and the irreversible loss of consciousness? Is the classification of a person as dead a moral judgment, or is it an entirely scientific matter? Is death a misfortune to the person who dies? How can death be a misfortune if you are no longer around to experience that misfortune? Is it possible to survive after death? What does it mean for you to survive after your death? Is there such a thing as an immaterial soul distinct from your body? Is immortality something you should want in the first place? Even if you do not live forever, is it nevertheless important that humanity continues to exist after your death? By discussing these questions about death, we will hopefully gain insight about the importance and meaning of life.

First-Year Seminars are available only to first-year students. 2025 Fall (4 Credits)

Skepticism and Knowledge

T 0300 PM - 0500 PM

Instructor Permission Required

Catherine Elgin

Descartes wrote his Meditations because he realized that, although he had received the best education in the world, much of what he had learned was false or unfounded. This led him to embark on a systematic investigation to discover whether knowledge is possible. Harvard freshmen face a similar predicament. Having dutifully learned what they were taught, and evidently learned it well, some find themselves questioning its cognitive adequacy. Much that they learned in school seems superficial, incomplete, oversimplified, or incorrect. Is it possible to know the way the world is? Can I know that I am not a brain in a vat being manipulated into thinking that I am an embodied human being? Can I know that the Louisiana Purchase occurred in 1803, that electrons have negative charge, that Hamlet is a masterpiece, that the sun will rise tomorrow? How can I tell whether a report is 'fake news'? Are there 'alternative facts'? Is uncertainty regrettable or valuable or both?

First-Year Seminars are available only to first-year students. Trials from Classical Athens and Modern Legal Debates

T 0300 PM - 0500 PM

*Instructor Permission Required**Adriaan Lanni*

In classical Athens, litigants represented themselves before hundreds of jurors who rendered verdicts without instruction from a judge. We will evaluate Athens' distinctively amateur legal system by reading surviving court speeches involving homicide, assault, adultery, international law, and commerce as well as Plato's account of Socrates' defense speech. We will analyze the speeches as pieces of legal rhetoric and for the insight they offer into ancient approaches to crime and punishment, the regulation of sexuality, the trial jury, and court procedure. Taught by a law professor, the focus will be on comparing ancient and modern approaches to problems faced by all legal systems. We will use the ancient material as a jumping off point to debate modern legal topics such as the role of victims in the criminal process, jury nullification, the proper exercise of discretion in prosecution and sentencing, the provocation doctrine in modern homicide law, transitional justice institutions (human rights prosecutions, amnesties, truth commissions); theories of punishment, the use of collective sanctions in international law, free speech and the protection of dissent in a democratic society, and direct vs. representative models of democracy. Approximately half of each class session will be devoted to discussing the Athenian cases, the other half to discussing analogs in modern legal debates.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 5 pm on Mon, August 11. If you are unsuccessful in the lottery, you may still join any seminar with open seats. A list of open seminars and instructions on next steps will be available on the First-Year Seminar Program website August 11 at 12 Noon.

Prior knowledge of ancient history or ancient languages is not required; all readings are in translation and the seminar is designed to be of interest to those without a background in the ancient world.

Requires: Course open to First-Year Students Only

FAS Divisional Distribution: None

Collecting the Past

W 0300 PM - 0500 PM

*Instructor Permission Required**Adrian Staehli*

This seminar will explore different historical practices of collecting and displaying Greek and Roman art and artefacts from the earliest periods of antiquity through the Middle Ages and the Renaissance to most recent times, including the contemporary debate about cultural property, the acquisition policies of museums, and the repatriation of looted antiquities to their countries of origin. The seminar will consider how various forms of collecting, archiving, and displaying – such as collections of war booty in ancient Rome, cabinets of curiosities in the European Renaissance, or modern art museums from the 18th century onwards – have shaped our knowledge and understanding of Greek and Roman culture and art, and, more generally, of the past, and how they have contributed to the emergence of new forms of aesthetic appreciation and new approaches to the understanding and interpretation of ancient art and material culture. This seminar will be designed in connection and cooperation with the major exhibition on Celtic Art which will be staged by the Harvard Art Museums in Spring 2026 and will include frequent museum trips to the Harvard Art Museums as well as to the Museum of Fine Arts in Boston to study important art works relating to this class.

Course Note: The seminar will include required field trips to museums in Boston and Cambridge, dates to be arranged. Transportation and entrance fees are provided free of charge.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. Requires: Course open to First-Year Students Only

Animation--Getting Your Hands on Time

R 1200 PM - 0330 PM

*Instructor Permission Required**Ruth Lingford*

Students in this practice-based seminar will experiment with a variety of animation techniques, gaining new

HARVARD UNIVERSITY 689 of 1792

perspectives on time in the process. Drawn animation breaks down time into frames, helping us to understand time both as a liquid flow and a sequence of distinct infinitesimals. Pixilation, a technique from the beginning of cinema, allows us to interrupt and reassemble the continuity of movement. Stratacut lets us think of time as a solid. Editing gives us the power to manipulate time. For the first half of the semester, students will be introduced to a new technique each week, and will be given an assignment to start in class and finish before the next one. The second half of the semester will be spent working on short individual projects, which may build into a longer class project.

Course Note: The length of the class meeting will allow for studio time. There will be screenings on Friday 12-2. While these are recommended, they are not mandatory.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 10am on Mon, August 11th. If you are unsuccessful in the lottery, you may still join any seminar with open seats. A list of open seminars and instructions on next steps will be available on the First-Year Seminar Program website August 11th at 12 Noon.

No previous experience of drawing or animation is required.

Complexity in Works of Art: Ulysses and Hamlet

2025 Fall (4 Credits)

W 0945 AM - 1145 AM

Instructor Permission Required

Philip Fisher

Is the complexity, the imperfection, the difficulty of interpretation, the unresolved meaning found in certain great and lasting works of literary art a result of technical experimentation? Or is the source extreme complexity—psychological, metaphysical, or spiritual? Does it result from limits within language, or from language's fit to thought and perception? Do the inherited forms found in literature permit only certain variations within experience to reach lucidity? Is there a distinction in literature between what can be said and what can be read? The members of the seminar will investigate the limits literature faces in giving an account of mind, everyday experience, thought, memory, full character, and situation in time. The seminar will make use of a classic case of difficulty, Shakespeare's Hamlet, and a modern work of unusual complexity and resistance to both interpretation and to simple comfortable reading, Joyce's Ulysses. Reading in exhaustive depth these two works will suggest the range of meanings for terms like complexity, resistance, openness of meaning, and experimentation within form.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. Broadway Musicals: History , Race, and Performance

2025 Fall (4 Credits)

T 0945 AM - 1145 AM

Instructor Permission Required

Carol Oja

This seminar explores a group of canonical Broadway musicals, pairing historical and musical discussions with staging of individual scenes. The stagings will be done under the guidance of Allegra Libonati of the A.R.T. Institute. Throughout, there will be a strong emphasis on race – as embedded in the story lines of shows, their musical styles, and casting decisions. The seminar will touch on signal moments over the course of the "Golden Age" of the musical, stretching up to the present: Show Boat (1927), Oklahoma! (1943), On the Town (1944), South Pacific (1949), West Side Story (1957), A Chorus Line (1975), In the Heights (2008), and Hamilton (2016). This seminar is offered through the Harvard Radcliffe Institute and will draw on the resources of the Schlesinger Library, a major repository for the archives of women. Student musicians and actors are welcome in the course, as are students who love to watch shows but do not necessarily view themselves as performers.

Course Note: This is a Radcliffe First-Year Seminar and will include optional co-curricular activities related to the seminar topic. The seminar will be held at the Radcliffe Institute, Knafel 104, 18 Mason St.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply

to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 5 pm on Mon, August 11. If you are unsuccessful in the lottery, you may still join any seminar with open seats. A list of open seminars and instructions on next steps will be available on the First-Year Seminar Program website August 11 at 12 Noon.

The Art and Craft of Acting

2025 Fall (4 Credits)

M 0300 PM - 0530 PM

Instructor Permission Required

Remo Airaldi

We've all watched a great performance and wondered, "How did that actor do that?" Acting is undoubtedly the most popular, most widely appreciated of the performing arts, and yet, in many ways, it remains a mystery. This seminar will give students an opportunity to demystify the art of acting by introducing them to the basic tools of the trade—they will learn about the craft of acting by actually "doing" it. It will provide an introduction to acting by combining elements of a discussion seminar with exercises, improvisations and performance activities. Improvisation will be used to improve group/ensemble dynamics, to minimize habitual behaviors, and to develop characters. Students will explore a range of acting techniques designed to give students greater access to their creativity, imagination and emotional life. The aim will be to improve skills that are essential to the acting process, like concentration, focus, relaxation, observation, listening, collaboration and so on.

Course Note: Students will attend and critique theatrical productions in the Boston area. There will be no charge to the students.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 5 pm on Mon, August 11. If you are unsuccessful in the lottery, you may still join any seminar with open seats. Human Rights, Law and Advocacy

2025 Fall (4 Credits)

W 1200 PM - 0230 PM

Instructor Permission Required

Susan Farbstein

Human rights practitioners confront numerous ethical, strategic, and legal dilemmas in their struggles for social justice. This freshman seminar explores the underlying legal frameworks in which human rights advocates operate, and then uses specific case studies to consider the various challenges they must grapple with in their work. The seminar is designed to encourage students to critically evaluate the human rights movement while offering an introduction to some of the essential tools and strategies used by human rights advocates, including advocacy, litigation, documentation, and report writing. Students will consider tough questions, such as: How can human rights be harnessed to successfully influence and change behavior? What does responsible, effective human rights advocacy look like? How do we engage without perpetuating power differentials along geopolitical, class, race, gender, and other lines? How do we find ways to work in collaboration with directly affected communities? What does it mean to be a human rights advocate working on abuses affecting individuals and communities remote from yourself? How do you balance broader advocacy goals with the needs of individual survivors or clients? How do you determine when to intervene and devote limited resources to a given issue? Finally, the seminar considers the limits of the human rights paradigm and established methodologies, such as litigation and "naming and shaming," and explores alternative sources and forms of advocacy, including the role of community lawyering in the human rights context.

Course Note: This seminar will meet for 2 hours only, Weds, 12:30-2:30.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 5 pm on Mon, August 11. If you are unsuccessful in the lottery, you may still join any seminar with open seats. A list of open seminars and instructions on next steps will be available on the First-Year Seminar Program website August 11 at 12 Noon.

FYSEMR 42C

The Role of Government

W 0300 PM - 0500 PM

Oliver Hart

Course ID: 160196

2026 Spring (4 Credits)

Instructor Permission Required

Economists have a very positive view of the role of markets. The intellectual foundations of this are the first and second theorems of welfare economics. The purpose of the seminar is to introduce the students to these results but also to their limitations. Most economists think that market outcomes will fail to be efficient in the presence of large-scale externalities/public goods, and government intervention is then justified. Examples are national defense, clean air, and the mother/father of them all: global warming resulting from carbon emissions. Another very topical issue is inequality. There is no particular reason to think that a market economy will yield an equitable distribution of income, and given this what is the appropriate government response? Throughout the seminar the analysis of ideas and concepts will be interspersed with policy issues such as whether and what limitations should be placed on the right to smoke or consume drugs, the right to have an abortion, and the right to buy and sell organs. We will also consider the pros and cons of affirmative action, the Affordable Care Act (Obamacare) and the role of government nudges.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 5 pm on Mon, August 11. If you are unsuccessful in the lottery, you may still join any seminar with open seats. A list of open seminars and instructions on next steps will be available on the First-Year Seminar Program website August 11 at 12 Noon.

Student should have taken Economics 10A or more advanced in fall term.

FYSEMR 43F

When Bad things Happen Early in Life: Effects of Early Adversity on Brain & Behavioral Development

M 1200 PM - 0245 PM

Charles Nelson

Course ID: 224570

2025 Fall (4 Credits)

Instructor Permission Required

Decades of research tell us that the foundations of healthy development are built early in life. Genes provide the basic blueprint for brain architecture, but experiences shape the activity of the genome and thus determine how the circuitry is wired. Significant adversity can derail developmental processes and distort brain maturation, leading to limited economic and social mobility. Exposure to significant adversity early in life, particularly during critical periods of brain development, may increase risk for a host of chronic physical health problems, including cardiovascular disease, hypertension, diabetes, and addictive behavior; it can also lead to a variety of mental health problems, including depression and anxiety and characterological problems. Science clearly indicates that the longer we wait to intervene on behalf of such children, the more difficult it becomes to achieve healthy outcomes. This constraint is particularly true for children who sustain the wear and tear of early exposure to so-called "toxic stress". In this seminar we will critically examine the range of adverse early experiences that impact children growing up in both low and high resource countries. Key themes include a) the nature of the adversity children are exposed to, b) the timing of the adversity c) the chronicity of the adversity, and d) individual differences (including genetic and environmental factors that may confer protection on children exposed to early adversity). We will pay particular attention to the short- and long-term outcomes on physical, neurological and psychological health.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. The Economist's View of the World

Course ID: 108562

2025 Fall (4 Credits)

N. Mankiw

This seminar's goal is to probe how economists of various perspectives view human behavior and the proper role of government in society. Over the semester, seminar participants will read several brief, nontechnical, policy-oriented books by prominent economists. The participants will discuss each work's strengths and weaknesses, exploring the positive scientific judgments and normative value systems that underlie the author's policy prescriptions. To prepare for each book discussion, seminar participants are expected to send the instructor a brief email describing their views of the reading. In addition, each participant will have the opportunity to write his or her own essay addressing an economic policy issue. The essay will be read and discussed by all seminar participants.

Course Note: Please note that this seminar will be taught in two sections in Fall 2025:

Section 1: Tues, 9:45-11:45am — Section 2: Thurs, 9:45-11:45am

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. You will be notified of lottery results for both fall and spring seminars at 10am on Mon, August 11th. If you are unsuccessful in the lottery, you may still join any seminar with open seats. A list of open seminars and instructions on next steps will be available on the First-Year Seminar Program website August 11th at 12 Noon.

Students are expected to have had some background in economics, such as an AP economics course in high school or simultaneous enrollment in Economics 10a.

History, Nationalism, and the World: The Case of Korea

2025 Fall (4 Credits)

M 0300 PM - 0530 PM

Instructor Permission Required

Sun Joo Kim

This seminar will explore the quandary that faces all historians: To what extent is the understanding of past episodes influenced by current politics and to what extent is current politics influenced by people's understanding of the past? In the study of Korean history, this question is particularly sharp since the postcolonial division of Korea into North and South has thrust the memory of past events into current political discussions as well as scholarly debates. The seminar will investigate selected events in Korean history to map the interaction between historical writing and politics: the origins of Korea; Korean territory and the Korean people; cultural contacts with China and Japan and indigenization; social and regional marginalization and discrimination; Confucian

transformation of Chosŏn Korea and its legacy in contemporary Korean culture; the legacy of pre-World War II Japanese occupation; and the contending history of popular movements and religion. Why have some historians pictured Korea as a Japanese colony, a miniature replica of China, or a local variant of Chinese civilization? Why have other historians emphasized certain periods and aspects of Korean history while ignoring others? How have historians described Korea's relationships to China, Japan, and the rest of the world? Has the perception of Korea as a marginalized people and region influenced how its history has been described? Are there any connections between popular traditions and movements and this historical and scholarly discussion? Reading (all in English) will include translated primary documents as well as political and historical studies. Students are required to write five short critical essays in addition to weekly Web posting.

Course Note: All readings will be in English.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. FYSEMR 47U

Declarations of Independence: The Political Philosophy of the American Revolution

Course ID: 226320
2025 Fall (4 Credits)

W 1245 PM - 0245 PM

Instructor Permission Required

David Armitage

As the 250th anniversary of the US Declaration of Independence approaches in 2026, this seminar will examine that familiar document in some unfamiliar contexts. At the same time, it will provide a focused introduction to the development of modern ideas of rights, nationality, and statehood and will encourage students to place the United States in historical perspective and within an international context. The Declaration drew upon two centuries of arguments justifying rebellion, secession, and rights. It spoke to concerns and arguments arising out of contemporary British and American political thought. It was also the culmination of a series of similar declarations from colonies and towns and of a series of manifestos and papers issued by the Continental Congress. The seminar will examine these other documents, along with the successive versions of the Declaration in manuscript and print, in order to understand the political philosophy of the American Revolution. It will then examine the earliest replies to the Declaration, the many other American declarations of independence during the course of the nineteenth and twentieth centuries, and the various translations, imitations, and analogues of the American Declaration produced by later nationalist, secessionist, and anti-colonial movements up to the present.

Course Note: The seminar will also coincide with the opening of the nation's major exhibit on the Declaration for 2026 at the Museum of the American Revolution in Philadelphia. A class visit to Philadelphia is planned for the opening in October 2025. The trip will be free of cost to the student.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. As part of your application, you must provide a brief statement on why you are interested in each seminar. The Holocaust in History, Literature, and Film

Course ID: 119999
2026 Spring (4 Credits)

M 0345 PM - 0545 PM

Instructor Permission Required

Kevin Madigan

This seminar will approach the Nazi persecution of European Jewry from several disciplinary perspectives. Initially the seminar will explore the topic historically. In these weeks, the seminar will use a variety of historical materials dealing with the history of European anti-semitism, German history from Bismarck to the accession of Hitler, the evolution of anti-Jewish persecution in the Third Reich, and the history of the Holocaust itself. Sources to be used will include primary sources produced by the German government 1933-1945, by Jewish victims-to-be or survivors, documentary films, and secondary interpretations. The aims of this part of the seminar will be to understand the basic background to and narrative of the Holocaust, to introduce freshmen to the use of primary historical sources, and to familiarize them with some of the major historiographical debates. Then the members of the seminar will ponder religious and theological reactions to the Holocaust. Here the

seminar will use literary and cinematic resources as well as discursive theological ones. The seminar will also consider the historical question of the role played by the Protestant and Catholic churches and theologies in the Holocaust. The seminar will conclude with an assessment of the role played by the Holocaust in today's world, specifically in the United States. Throughout the seminar, participants will use various literary and cinematographic sources and test their limits in helping to understand and to represent the Holocaust.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. You may apply to as many seminars each term as you would like, but we recommend you apply to at least six in fall and three in spring. Measurements of the Mind: The Creation and Critique of the Psychological Test

Course ID: 121907
2025 Fall (4 Credits)

M 0900 AM - 1100 AM

Instructor Permission Required

Marla Eby

For well over a century, psychologists have worked with schools, corporations, immigration officers, the military, and psychiatrists to sort the American population into groups in order to make a number of key judgments.

Special tests – designed to measure everything from intelligence to vocational aptitudes to personality – have been at the center of that effort. In this seminar, we will explore the at times controversial story of psychological testing, and its larger implications. We will pay attention to the creativity within psychology in the making of such tests, and examine their potential benefits, as well as the drawbacks and dangers of the misuses of these instruments – particularly as tools of social control. Topics covered will include the use of tests in the eugenics movement, testing of immigrants at Ellis Island, academic and military sorting through cognitive tests, the use of personality tests in psychiatric and forensic settings, and the cross-cultural use of personality tests by anthropologists. Since Harvard psychologists have made significant contributions to the history of psychological testing, we will use materials uniquely available on this campus in the course of our work together.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. Science in the Age of Artificial Intelligence

Course ID: 207514
2025 Fall (4 Credits)

R 0300 PM - 0545 PM

Instructor Permission Required

Brendan Meade

Science is focused on discovering and explaining the world around and within us. This has been its goal for hundreds of years and has produced astonishing breakthroughs from population genetics, to general relativity, to plate tectonics. Artificial intelligence is touted as a tool for learning about a complex system in ways that humans can't and has seen exceptional progress in natural language processing and image identification. In this class we explore the emerging linkages between scientific inquiry and artificial intelligence. The central goal of this class is to question the classical role of the scientist as a creator of theories and consider how scientists may become interpreters of theories developed by AI. We do this by developing an understanding of how AI systems actually work (they're astonishingly simple), explain recent success cases, and then consider how we may (or may not) rebuild science in an AI-first manner. Examples will be drawn from the earth and planetary sciences as well as the life sciences.

First-Year Seminars are available only to first-year students. You may apply to both Fall 2025 and Spring 2026 First-Year Seminars via the FYS lottery between July 7 and August 7, 2025 at 11:59PM-midnight. The Story of the Alternating Sign Matrix Conjecture

R 0300 PM - 0515 PM

Lauren Williams

Course ID: 207517

2025 Fall (4 Credits)

Instructor Permission Required

This seminar is intended to illustrate how research in mathematics actually progresses, using recent examples from the field of algebraic combinatorics. We will learn about the story of the search for and discovery of a proof of a formula conjectured by Mills-Robbins- Rumsey in the early 1980's: the number of $n \times n$ alternating sign matrices. Alternating sign matrices are a curious family of mathematical objects, generalizing permutation matrices, which arise from an algorithm for evaluating determinants discovered by Charles Dodgson (better known as Lewis Carroll). They also have an interpretation as two-dimensional arrangements of water molecules, and are known in statistical physics as square ice. Although it was soon widely believed that the Mills-Robbins-Rumsey conjecture was true, the proof was elusive. Researchers working on this problem made connections to invariant theory, partitions, symmetric functions, and the six-vertex model of statistical mechanics. Finally in 1995, all these ingredients were brought together when Zeilberger and subsequently Kuperberg gave two proofs of the conjecture. In this seminar we will survey the story of the alternating sign matrix conjecture, building up to Kuperberg's proof. If time permits, we will also get a glimpse of very recent activity in the field, for example the Razumov-Stroganov conjecture.
